15,150. Does it frequently happen that you refuse traffic which you could obtain by carrying it at a very low rate ?—Occasionally ; but I do not think frequently. I have known cases in which they have been obliged to refuse it, as being entirely unremunerative without any ulterior object ; but I think that is quite an exceptional case where it has arisen.

15,151. Do you hold the same opinion with regard to the traffic in goods ?—Clearly. With regard to goods, cases constantly arise whether from the quantity which is offered it may be well worth while to get a traffic which you would not otherwise get by relaxing what may be the regular rate of the day, and the more readily that can be done the more you can develop the traffic. If any rigid law were laid down of an equal mileage rate which you could not relax, there would be constantly cases arise in which the traffic would be entirely stopped.

15,152. (*Mr. Horsfall.*) Still you would put all traders upon the same footing ?—Yes. I think if a man came to me and said, I have got a vessel coming in with a large cargo, which I want taken to a particular place, and instead of sending it round by sea, I will send it by your rail if you will take it at a reduced rate, I say, I agree to that at once ; but if a second man came to me to take another cargo on the same terms, I should hold myself bound to agree to the same course.

15,153. (*Capt. Galton.*) How could that be secured to the public if there was not a law that you were to carry at the same charges under similar circumstances ?—That is the law now. I think that is the case under similar circumstances.

15,154. Would you compel a railway company to publish the charges which they were giving to an individual trader, so as to enable the rest of the district to know them ?—I think in cases of the sort I have mentioned it is an impossibility that you should do so. If you were to publish your charges, and were strictly to adhere to them, you would be prohibited from giving those advantages which constantly arise to the public from making a relaxation in them.

15,155. How are the other traders, who are carrying on the same trade, to know that these charges are being made under certain special circumstances ?—There are cases which arise on the spur of the moment, from the force of circumstances, which are quite exceptional cases, they are not the rule. I think you must adopt the rule ; and there is no rule without its exceptions, and treat these as exceptional cases.

T. E. Harrison, Esq.

22 Mar. 1866.

15,156. But still you admit that any one who was going to carry traffic under the same exceptional circumstances ought to have the same rate?—Beyond all question.

15,157. How would you let such a man know that those rates had been given to other parties?—I think that is the great difficulty which arises, because those are quite exceptional circumstances to the fixed rates which are charged, and in all probability you might not have two cases of that sort which were exactly similar in a year.

15,158. What security has the public that they would be treated alike unless you publish the rates?—I do not think you could publish the circumstances of such a case as that.

15,159. Then, in fact, the public could have no security?—Yes, I beg your pardon in that. It is a matter of the greatest difficulty to publish what your rates are, because the rates amount to several millions in number, all different. Rates to all the stations in the kingdom, from different stations, amount to some millions in number. I do not see how you can possibly publish the rates, but taking the large questions, the coal traffic, for instance, there is never any difficulty at all about the whole of the public knowing what the rates are with regard to coal, but they are not published. If you take a large district of collieries, every coal owner knows, as well as we do ourselves, what his neighbour is charged. The rates are thoroughly well known.

15,160. Are the rates kept in books then?—Yes; the manager's rate book is not one volume, there are some dozens of volumes of them.

15,161. Would there be any objection to having such books accessible to the public at certain places?—Not the slightest; but as to any good which would be effected by it, that is another question. I should say there is not the slightest objection to the public referring to the books in which the regular rates are entered as much as possible.

15,162. Are there any exceptional rates published in such a book?—There is always the amount when a special rate is made, but it is under special circumstances.

15,163. (*Sir R. Hill.*) Would there be any objection to an entry being made of the special circumstances, and consequently of the special rates in this book?—I see none whatever.

15,164. And you see no objection to making it accessible to all?—No; of course the only object that the railway company has to care about is to get traffic under particular circumstances, and in a particular state of things, and if they found it to be to their interest to do it in one case they would only be too glad to do it in every case. There can be no possible reason why they should not do it.

15,165. (*Chairman.*) Are what you call special cases of frequent occurrence?—They are not of frequent occurrence.

15,166. What sort of cases are of the most frequent occurrence?—I have known cases where special rates have been made of this kind. A large cargo of iron has to be delivered at a certain place, and it might be a question whether it was wanted at a particular time, and whether they would make a certain reduction in the rate which would enable it to be sent by a particular route instead of by some other route, time being perhaps an object. Knowing that if you did not get it it might go by the other route, the question you have to consider is, whether it is worth your while to take it a great deal below the regular rates of carriage. The question in that case rests a great deal upon the quantity. In the same way when very low rates are given for the carriage of coal, it is usual to make a stipulation that it shall be sent in full train loads, so that you do not have all the labour of sorting out waggons, which is a large expense. That again is a departure from the ordinary course of traffic.

15,167. You have stated it to be the rule with respect to coal that you allow the colliery owner to send his coal to any of your ports at the charge fixed to the nearest port?—Yes.

15,168. Is the same rule applicable to goods?—We make the same rule applicable to all goods for shipment.

15,169. Is Hull included amongst those ports?—Yes; Hull, in point of fact, being the nearest, regulates the charge. That rule resulted partly from myself at the time when I happened to be the manager of the North-eastern railway. We proposed at that time an amalgamation with the Leeds Northern railway, which had an independent line of its own to Hartlepool, and on our amalgamation I felt very strongly that, as we were carrying at the time for exactly the same rate to Hartlepool that we were carrying for to Hull, unless we made a provision that they were to be upon the same rate as then existing rate, which was an equal rate, that it might be doing great injustice to the port of Hartlepool. We were quite prepared to adhere to that, and not only so, but to extend it to the more distant ports of Sunderland, Shields, and the Tyne. We have acted upon it ever since, and the result of it is simply this, that a merchant may find at any one of those ports a vessel more convenient as to time than he could do in another at exactly the same cost to him, and therefore he has a larger selection of ports of shipment, and a larger number of vessels by which he may have the opportunity of sending his traffic. As far as the railway companies themselves are concerned, their largest profit clearly results from the nearest port, because the charge is the same. There is a great advantage to the public in it, and I think the principle is entirely sound.

15,170. Are the North-eastern Railway Company interested in any docks?—In all the docks except Hull. Our interest in the docks at Sunderland is merely through being the holders of a certain amount of shares at a fixed rate of interest. The commissioners of the river are the owners of the docks, but we make the same rate in all cases.

15,171. Are there any other docks in which the North-eastern have a large interest?—We have large docks on the river Tyne, which are chiefly used for the purpose of shipping coal. We have a dock of our own at Monkwearmouth, which is entirely used for the shipment of coal. We have docks also at Old Hartlepool and West Hartlepool, and we have also small docks on the Tees at Middlesborough.

15,172. Has the company large sums of money invested in those docks?—A very large sum of money.

15,173. Might it not be for their interest to increase the traffic of those ports in preference to Hull?—We have no power at all over the traffic. What we do is simply to fix the rate and make it equal. We have not one agent in any one of the manufacturing towns for the purpose of soliciting traffic for any one of our ports.

15,174. (*Capt. Galton.*) Would not the rate draw traffic?—The rate is equal; it is an equal gross sum.

15,175. Wherever the goods go to?—Wherever the goods go to; if you take goods from Manchester the same gross rate applies to all the ports.

15,176. (*Earl of Belmore.*) Is the West Hartlepool Dock and Railway Company amalgamated with the North-eastern?—They were amalgamated by a Bill of last year.

15,177. (*Capt. Galton.*) I suppose the company consider themselves fully entitled to charge what dock dues they like, in order to attract vessels to particular docks; I presume that would be a legitimate mode of attracting vessels?—Yes. In the case of the whole of the docks which we have the rates are all low, but the maximum charge is made throughout. They are all low in the original Act of Parliament, and the same maximum rate is charged in every case.

15,178. As a fact, are the rates higher at West Hartlepool than at Hull?—The maximum rates at West Hartlepool under the Act of Parliament are lower than the Hull Dock rates, and the Hull people are charged the maximum rates. We cannot alter the rates at all.

15,179. (*Mr. Horsfall.*) Goods going by way of Hull would have to pay a higher rate, including dock

dues, than goods going by way of West Hartlepool, would they not?—That is so; as far as the shipping is concerned, the vessel pays somewhat higher rates at Hull than it does at any other of the ports.

15,180. Do they not have to pay dock dues at the other ports?—No; the whole of the equal rate is for putting the goods on board ship. There is no difference in regard in that, but when they come to the actual charges upon the shipping, then the rates at Hull are higher than the rates at West Hartlepool.

15,181. Do you mean to say there are no dock dues charged upon the goods shipped?—No; the gross rate includes everything, it is a charge for putting them on board the ship.

15,182. (*Chairman.*) I suppose there is some limit to the rule of equal charge to all points, and that points in the immediate vicinity are not charged as much as distant points?—No. If the rate were based originally upon a distance of 10 miles, of course it would be impossible to apply it to a distance of 100 miles, but the cases to which we do apply that rate certainly do not vary to the amount of more than 20 per cent. for the increased distance, taking the rate to the nearest point.

15,183. Has this system been adopted for several years?—Yes, since the year 1853.

15,184. So far as you can judge do the public generally in your district approve of the system as it is now in force?—I think there cannot be any doubt about that. I may state that by various amalgamations we have become the largest amalgamated company in the kingdom as regards the number of lines amalgamated, being composed of 25 different lines of railway. We last year amalgamated with the last existing company in the district, namely, the West Hartlepool, and we received a petition in favour of that amalgamation signed by every ironmaster in the district, and by every coal owner, with the exception of two, in the district affected by it, and that petition was signed by traders who were paying the North-eastern Company 700,000*l.* a year in tolls, and they unanimously signed a petition in favour of an amalgamation. That was as strong an indication of the general feeling of the district as anything could be.

15,185. I believe you have frequent complaints from Hull as to the operation of your system, have you not?—There is a great difference of opinion in Hull upon the question; but I think for several years there has hardly occurred a session in Parliament in which Hull merchants have not appeared to enforce the principle of an equal mileage rate throughout. We have always seen the same gentlemen appearing before committees. If you want to stop the whole of the commerce of the country, I am quite satisfied you could not do it more effectually than by adopting such a principle. The whole of the traffic of the railways depends upon differential rates, but to lay down any sort of uniform mileage would literally be to stop nine-tenths of the traffic of the country. I express that opinion from actual experience of it.

15,186. (*Earl of Belmore.*) You stated just now that up to a certain limit you charge 2*s.* per ton?—Yes.

15,187. Beyond that limit you still charge 2*s.* per ton?—We charge a very low rate.

15,188. Do persons who pay 2*s.* at the limit you fix complain that you do not charge more to people beyond that limit, or that you do not reduce the charge to them?—No, they do not.

15,189. (*Chairman.*) Have you any acquaintance with the system pursued on foreign railways?—Nothing more than travelling over them. I have no practical knowledge of them.

15,190. You do not know whether their system is to adopt an equal mileage rate?—I am quite aware that that was their system. Some gentlemen were sent to this country by the French government some time ago, who came to me for information upon this very subject. I do not know what the result of their report was, but their views as expressed to me were clearly in favour of the system that is adopted in England. I am not at all aware of the result of their report.

15,191. (*Lord Stanley.*) The system that you defend, as I understand it, applies to the inequality of charge between places at different distances?—Yes; it may be the same rate, as is practically the case with goods and passengers for a long distance from Scotland, that the same rate, with the exception of half-a-crown, is applicable to a passenger who goes to Edinburgh, and one who goes to Perth, and one who goes to Aberdeen from London. You only pay half-a-crown more if you go to Aberdeen than you do if you stop at Edinburgh. If the charge were raised to Aberdeen the passenger would look twice before he paid the larger sum; and if you adopt the same mileage rate to Aberdeen, which is the principle that these gentlemen have advocated, it is quite clear that the Aberdeen man would be charged something like 60 per cent. more, and it would be a most onerous charge, and he would not travel at all.

15,192. (*Capt. Galton.*) Or else he would come by steamer?—He would very likely come by steamer; but still it would reduce the amount of travelling very much.

15,193. You would only get the traffic by charging the lower rate?—Yes.

15,194. (*Mr. Horsfall.*) I understand you to say that, assuming that you charged a shilling for 10 miles, you would charge 2*s.* for 20 miles, and the same rate for 30 miles?—I had not in my mind the exact figures, but perhaps the rate if it were 10 miles would be more than the mileage rate as compared with the 20 miles. The 10 miles would be 1*s.* 3*d.*, and on the 20 miles, if that were the distance, it would be 2*s.*, and would become the maximum, and if it were 30 miles 2*s.* would be the maximum still.

15,195. Would you extend that principle further and say that 2*s.* should be the rate for 40 miles or even 50 miles?—No. There is a limit to that, because you get to a point where, if you are to carry 60 miles for the same rate that you carry for 20, namely, 2*s.*, it would in all probability absorb the whole of the profit. Therefore you cannot apply that example of the limit which I have stated, beyond all probability something like 30 or 40 per cent. on what is a fair paying distance.

15,196. (*Earl of Belmore.*) The way in which the public would suffer if you absorbed the whole of the profit would be that they would not be accommodated at all?—If you had no profit you could not go on working the line.

15,197. (*Chairman.*) Are your local rates equal over your whole system with respect to passenger fares?—They are not; they vary. I think they always must vary, in the first place, with the extent of population, and then from the nature of the population. At the time that I became, from peculiar circumstances, manager of the lines in that district, the Committee of Investigation thought that all the rates ought to be revised. There were two or three cases which became so patent upon the face of them as to the effects of the revision that they were altered; and one happened to be at the station to which I was in the habit of going every morning. They raised the fare from 3*d.* to 4*d.*

15,198. (*Sir R. Hill.*) What was the distance?—The distance was about four miles. I think the lower fare was from 2*d.* to 3*d.* for the same distance. I am taking merely the second and third class fares. The effect was absolutely to annihilate the traffic, although the difference in the charge was so small. I made special inquiry into it at the time, and I found that the difference enabled the people to walk, and that the turnpike road was actually carrying the traffic instead of the railway. The second case was this: that a special train had been established as a market train on Saturday; that train at the time consisted of from 16 to 20 carriages every Saturday morning. I do not recollect the exact figures, but I think the fare was 9*d.* for a return ticket, and it was raised to 1*s.*; the consequence was, that in three or four weeks that train came in with only four carriages. I think we are at the present

T. E. Harrison, Esq.

22 Mar. 1866.

moment in our infancy as to our knowledge of what really will produce the largest amount of traffic, and at the same time be a remunerative one. That is a thing we can only learn step by step. Those two cases so convinced me of the small amount which will create a traffic or destroy it, that I am of opinion that with regard to an alteration of fares we can only proceed step by step as we go on.

15,199. I presume part of the difficulty results from the necessity of allowing a considerable time before you can ascertain the effects of a change?—You can only ascertain the effects of a change by having the most complete statistics of the result of it.

15,200. (*Capt. Galton.*) I suppose the change of reducing fares would not make itself felt so rapidly as the change you have alluded to of the increase of fares?—Certainly not. When you make a reduction in the fares it takes a considerable time before you find out the result of it, either one way or the other.

15,201. People have to learn it?—Exactly; but the moment you alter a fare by raising it, as in this case, it is known at once; the change is most sensible. In fact, when they altered the fare back again it was some months before they got back the number of passengers they had before.

15,202. (*Mr. Horsfall.*) Have you tried the effect of any material reduction, such as 25 or 20 per cent.?—At the present moment, in the case of the North-eastern, we have been gradually reducing the fares. That reduction will be fully 25 per cent. in the course of another year; we are doing it by degrees, and my own view is, that the result will be that the company will sustain no loss whatever by it. I have advocated the question of a gradual reduction of fares, and I am not at all prepared to say that eventually, where you have a large population, for instance, two large towns, that a lowering of the fares to a very small amount will not largely increase the number of passengers and also the amount of profit. Of course, where you have a thin population all you can do will not increase the amount of your traffic. That is a question of experience in which, I think, railway companies can only go on from step to step to ascertain how it works.

15,203. Take, for instance, two towns like Manchester and Liverpool, where there are half a million of people at each end, do you not suppose a reduction of 25 per cent. would prove to be a material benefit to the railway companies?—I think it would; but as far as my experience goes it is not a small reduction that affects the question; it is not a question of mileage reduction; but parties look to the gross amount that they have to pay. You have to give them something which will induce them to travel. I think it is a thing which requires to be gone into with great caution. Nothing is more difficult than to raise a fare, but when you have once reduced it, and found it not successful, it always brings such a large amount of discredit on the company to raise it again that it compels them to be very cautious how they do it, and that renders it necessary that they should feel their way.

15,204. (*Sir R. Hill.*) That is your reason for proceeding gradually?—Yes.

15,205. When you say that the effect produced by a small reduction is not marked, I presume you mean that the effect is in proportion to the reduction, whether large or small, is not that so?—Clearly. I believe that many of the rates in the district with which I have been more particularly connected are, perhaps, lower than on almost any railway in the kingdom. I believe that a low rate is exceedingly beneficial both to the company and to the public. The question of the amount of the rate does not affect a purely agricultural district so much as a manufacturing district, because the agriculturists have not time to travel, and they generally take advantage of cheap trains. Where you have a large population, I believe, even if we look forward to 10 or 20 years, that we shall see the rates a good deal below those which exist at the present time.

15,206. (*Chairman.*) When you spoke of a gradual reduction of rates, did you mean that the system has been gradually introduced upon different portions of your lines, or that the rates have been reduced step by step?—The mode of dealing with it is a question of some difficulty. The directors came to the resolution of making a large reduction, and as the amount on the face of it would be considerable, they have adopted the plan of doing it by districts.

15,207. Have you made the whole reduction at once in those particular districts?—Yes; the public would not thank you for making the reduction in driblets, and placing the whole amount of reduction over three or four half years, but if you take a district and make the whole reduction, they feel it; I believe, as far as my experience goes, that the railway company in the end will benefit by it.

15,208. (*Lord Stanley.*) I infer from what you said as to a reduction having been effected between large towns that if it were desired to try an experiment upon a large scale, as has been suggested, at the cost of Government, the place to try that experiment would be either between Liverpool and Manchester or between London and Birmingham, or some stations of that kind, and not an agricultural country like Ireland?—Clearly. With regard to Ireland, my knowledge of the traffic of Ireland is so limited that I would hardly venture to offer an opinion upon that, but I think there can be no doubt that if such an experiment were to be made, it ought to be made between large towns where people would really have an inducement to travel.

15,209. It ought not to be made in a district which is purely agricultural?—Certainly not.

15,210. (*Earl of Belmore.*) Do you think it would be attended with a certain loss?—I have no doubt that in the agricultural districts a large reduction would be attended with a loss.

15,211. (*Sir R. Hill.*) Is not proximity, within certain limits, a point to be considered?—It is.

15,212. You would not expect so great an increase in passenger traffic by lowering the fares between Birmingham and London as between Liverpool and Manchester?—Certainly not. You must have some object for the travelling population. If the fares were exceedingly low to London, there is an enormous inducement for all the people of Manchester to come to London to see what is to be seen; but still that has its limit. They might come up for cheap trips, but if you want to try the experiment upon a permanent basis for anything hereafter, then I say take such towns as Liverpool and Manchester.

15,213. Towns within a very moderate distance of each other?—Yes.

15,214. (*Mr. Gower.*) Do you find the rates of wages in any particular district has an influence upon the fares to be charged for the third class?—Yes, it has a large influence upon the amount of the travelling population; where wages are good and the trade of the district is prosperous the travelling is very largely increased.

15,215. Is it diminished again when wages are low?—It is diminished again beyond all question when wages are low. I went into that question as a matter of curiosity when I had an opportunity of doing so nearly 30 years ago, as between Newcastle and Sunderland, at a period when the shipbuilding trade had been bad, and I found that it made an immense difference in the amount of travelling between those two places.

15,216. (*Sir R. Hill.*) You have had strikes occasionally?—Yes.

15,217. Have those strikes affected the amount of the passenger traffic?—Undoubtedly.

15,218. Materially?—Yes, very materially.

15,219. (*Mr. Horsfall.*) When you were speaking just now of agricultural districts, you were referring to the traffic in passengers?—I was.

15,220. What do you think would be the effect of a reduction in the charge for cattle?—I do not know whether it would alter the question at all of the present traffic either in cattle or in agricultural produce. The lean cattle would be driven, as they are now. I may take the case of traffic coming to the north of England

from Scotland, where you see them travelling a certain distance in large droves. They can drive the lean cattle without doing them any harm, but they will always prefer sending fat cattle by railway. The rates for cattle are, I should think, the least complained of of any. You cannot add to the agricultural produce, and unless there is anything which will increase the produce of the district, I should not recommend a reduction of the rates for agricultural produce.

15,221. (*Earl of Belmore.*) In fact agricultural produce which has to go out of the district must go by rail?—In nine cases out of ten it does, and the result has been to enable the agricultural produce to find much more extensive markets than it has done before.

15,222. (*Chairman.*) Have you any extensive agricultural districts on the North-eastern railway?—The whole district of the York and Newcastle line, going through Northumberland to Kelso, is purely agricultural.

15,223. Has the reduction of fares which you speak of been introduced into those districts?—It has not.

15,224. Has it been introduced into any other agricultural district, such as the East Riding of Yorkshire?—The East Riding of Yorkshire is not yet within the limits; they reduce all within the neighbourhood of the manufacturing districts first, such as Leeds, and so on.

15,225. You are not able to speak from actual experience of the effect of a reduction of fares in purely agricultural districts?—I hardly am, although some alterations were made some years ago which rather led me to the conclusion that I have expressed, but I have not the actual statistics of it.

15,226. Do you know whether first-class passengers bear a greater proportion to the second and third class in the agricultural districts than they do in the manufacturing districts?—They do.

15,227. Are they much larger?—They are very much larger in proportion. In all the manufacturing districts the great bulk of the travelling population are third-class passengers.

15,228. (*Mr. Gower.*) Do you consider, as a general rule, that the effect of a reduction of fares is greater in a district where the wages are high than in a district where the wages are low?—That I am not able to say, but I do know that when wages are good the public travel a great deal more than when they are bad, but whether the effect of a reduction of fares would increase the proportion more where wages are high or where wages are low, I cannot say.

15,229. (*Mr. Horsfall.*) What is the rate of charge for coal on your railway?—It varies from 1*d.* per ton per mile on coal for shipment to three-eighths of a penny per ton per mile on coal sent to London. For short distances on coal for land sale the maximum rate is 2*d.* per ton per mile; that is for very short distances.

15,230. Do you consider that there is any room for a reduction of the rates generally charged?—Generally I think the rates are exceedingly moderate. There are cases where we are going on constantly reducing them. I think the result of our reductions on the coal rates for shipment one way or another within the last five or six years varies from 10 to 20 per cent., and I am bound to say that in some special cases where we have made that reduction, particularly referring to the question of a differential rate for longer distances, that the increased amount received from coals for the longer distances compensated us for the reduction on shorter distances.

15,231. (*Sir R. Hill.*) Do the rates you have named include the use of waggons?—Yes, except in the case of three-eighths of a penny per ton per mile to London, where the waggons are found by the Great Northern Company; but in the other cases they include everything.

15,232. (*Mr. Horsfall.*) Do they include the terminal charge?—They do not include the terminal charge.

15,233. What is the terminal charge?—I think it is about 1*s.* 6*d.* a ton, but I cannot recollect at the moment.

15,234. (*Chairman.*) Have you any observations to make with reference to the rates from Wales and Cleveland?—One of the most grievous complaints that we have from a large producing district is that Cleveland, being a less distance than the Welsh producing iron district, cannot get the same gross rate to Liverpool that is charged to Wales. Of course in the one case the system is entirely in the hands of one railway company, who make a low rate from Wales to Liverpool. It is one of the largest shipping ports for manufactured iron. The rate is 50 per cent. more from the Cleveland district than from Wales, as far as we are concerned, we have done all we can without the power of giving an equal rate. I should like to see in all cases of that sort that the same principle is adopted between railway companies that any individual railway company would adopt if the line were their own.

15,235. (*Capt. Galton.*) Is it not also the case that between Cleveland and London there is a very low rate given, and that between Staffordshire and London there is a higher rate?—I am not aware of that; but as between Staffordshire and London, if it is so, that would be a question which concerns railways of which I have no knowledge. I think the greater part of the iron from Cleveland to London would go by sea.

15,236. In fact your rate between Cleveland and London is limited by the rates charged by the shipping?—Yes. I should think the rate for any iron to be sent to London really would be inoperative, because they could take it so much more cheaply by sea.

15,237. (*Mr. Gower.*) Have you always adhered to the reduction of fares when you have once reduced them, and not raised them again?—With one exception, which I stated last year, in the case of an Amalgamation Bill, where we made an agreement for 15 years for a considerable reduction of rate. We do contemplate raising that again. That is the rate upon coals on the West Hartlepool Railway. We reduced the rate at the time upon the representation that certain things would be done which have not taken place, and at the expiration of that term we intend to have some addition to the rate; but otherwise, as a rule, I should say decidedly that where once a rate is established nothing could be more impolitic than for a railway company to raise it. It causes more popular abuse, if I may say so, than anything else.

15,238. (*Chairman.*) Now we will go to the question of terminal charges. Will you state what you understand by the designation terminal charges?—I take that to mean all the duties which a railway company have to perform after they have conveyed the traffic between two given points. Taking the original intentions of the Legislature when railways were first sanctioned, the object then clearly was that they should be treated as turnpike roads, and it was not the custom within my early experience ever to go into any calculation at all in making an estimate for a line of railway, for providing either stations, or any accommodations incident to stations. Circumstances have obliged railway companies to become carriers, and the terminal charge is literally that which is applied to the duties of carriers independently of the question of tolls. I had occasion some years ago, with reference to the question of coal, to take out the actual cost of all the coal depôts on the North-eastern system. I had the means then of ascertaining the total cost of them, and I also got the actual expenses of the railway company attending their working. I charged for the first outlay 5 per cent., and I found this to be the result, dividing those expenses so arrived at by the number of tons of coal sold at each individual place, I found that in places where there is a large sale, the cost being the lowest in any case amounted to 4*d.* per ton, and that varied at all rates up to 2*s.*, and in one or two cases it was 2*s.* 6*d.* per ton upon the coals sold at those depôts, and in some cases the actual cost added to what was charged for the con-

T. E. Harrison, Esq.

22 Mar. 1866.

veyance of the coals was more than the company got, even including tolls and everything else. Therefore it is a variable rate, and I do not know any other principle that you can adopt than that of regulating it as circumstances may require. You must fix a maximum. I believe our lowest rate of charge is down to 4*d.* In some cases we charge 1*s.* 6*d.*, and even higher for anything I know, but the actual cost in those depôts varied from 4*d.* to 2*s.* 6*d.* per ton.

15,239. (*Earl of Belmore.*) Do I understand you to say that in many cases you found you had actually been carrying coal at a loss?—Yes, in some cases, where the depôts were large in proportion to the amount sold, we were carrying them at an actual loss. I mean coals which were carried for a short distance.

15,240. (*Capt. Galton.*) Did that estimate of cost include interest upon the capital?—It was the cost of the depôts alone.

15,241. I presume there was a profit on the actual cost of the train without reference to the working expenses of the line?—There was no profit at all. There was a charge of 2*s.* 6*d.* per ton, which included terminals. I found in that case that the actual interest upon the outlay for the depôt came to 2*s.* 6*d.* per ton, and in addition to that there was the cost of haulage; but that was not so large an amount as to be worth making any alteration for. As a positive fact, that was so in some cases.

15,242. (*Chairman.*) Those rates only apply to some small country places I presume?—Yes.

15,243. If that were generally the case you would of course raise your charges?—My object in going into that at the time was to see whether the rates charged for terminals were too high or not. I am now speaking of about the year 1848.

15,244. (*Earl of Belmore.*) In those few cases there was a loss not only upon the terminals, but also upon the haulage?—There was an absolute loss upon the whole.

15,245. (*Sir R. Hill.*) I assume you now to include the charges at both ends of the line?—We have no charges at the other end; they are all merged into one. There is no separate charge on coals.

15,246. (*Chairman.*) Are you at present adding much to your sidings on the North-eastern system?—We are adding largely to our sidings. I do not know that there is any part of the old railways that has more additions now made to it than in sidings. In the case of the North-eastern Railway we have now about 1,200 miles of line working, of which a great deal is single line, and we have 705 miles of sidings (to which we are always adding), that is, exceeding three quarters of a mile for every mile of main line of railway; and taking our mineral districts, we have very nearly a mile of single line of sidings for each mile of main line. That is a large element in the cost of works. There is nothing that is more important than having a complete system of sidings to get the trains sorted, and when you consider how traffic is increasing, as it is in all parts of the country, the necessity for having those sidings becomes more apparent day by day.

15,247. Has there ever been any question as to whether your Acts of Parliament authorize you to consider all these elements as forming a part of the terminal charge?—There is no Act which distinctly refers to it, or which gives the railway company any distinct power to charge a particular sum. There is no maximum established in any Act of Parliament. In different Acts the wording as to terminals varies; I think it generally is "a reasonable amount." Of course that question of reasonable amount is left open to very wide construction.

15,248. Are not the charges authorized by your Acts of Parliament generally said to include every expense except that of loading and unloading?—I think some of the Acts go a great deal beyond that.

15,249. Do they generally include the cost of stations?—No.

15,240. Or interest upon the cost of stations?—There is nothing provided in any Act of Parliament with respect to that.

15,251. Who is to decide what is a reasonable charge?—I do not know that there is any one to decide that except the Court of Common Pleas. As the law exists at the present moment I do not know any one else who is to decide it.

15,252. Is there not generally in every Act some clause to this effect:—"It shall not be lawful for the "company to charge in respect of the several articles, "matters, and things, and of the several descriptions of "animals, herein-after mentioned, conveyed on the rail-"way, any greater sum, including the charges for the "use of carriages, waggons, or trucks, and for locomo-"tive power, and all other charges incidental to such "conveyance (except a reasonable charge for the ex-"penses of loading aad unloading, where such service "is performed by the company), than the several sums "herein-after mentioned (that is to say)." Do you think under those terms that you can charge for all the expenses that you have incurred?—For all the expenses which are incidental to the loading and unloading. You have a large station to build, and you cannot load or unload any perishable goods except under cover, and the cost of that building to enable you to do the work is in my opinion clearly one of the charges that are incidental to the loading and unloading. What has always appeared to me to be a fair mode of testing the question as to what is a reasonable amount for loading and unloading is to consider that when a locomotive engine brought a train and placed it in a siding, the work for which you earned the toll was done, and if carriers were doing the work which the railway company now does, they will commence their work for which they would be entitled to make a charge from the moment the locomotive engine deposited the train in the siding. Then everything that becomes afterwards a charge clearly comes, in my view of it, under the denomination of charges for loading and unloading, and not, as I believe some parties have occasionally stated it to be, for the simple labour of loading and unloading; in fact it could not be carried on, perishable goods could not by any possibility be loaded in the open air; there must be shed room for that, and the expenses of those buildings are great. I am at the present moment going to let the contract for a new station for the additional goods traffic of Newcastle, which station, with the necessary sidings attached to it, will cost 150,000*l.* These are matters totally irrespective of any questions of mere toll.

15,253. Have there been any cases in which the public have disputed your right to include interest for station accommodation in terminal charges?—I do not know that the question has ever been decided by any court of law, and taking the generality of cases, the maximum rate of charge of toll is so seldom charged, the terminal being merged in the through rate, that the question does not often arise.

15,254. In many cases the whole charge, including the terminal, is less than the maximum you are authorized to charge from station to station?—That is so in most cases, but there are some instances in which the terminal charge is no doubt charged, such as the conveyance of furniture, and things of that sort, which are quite exceptional cases, and in which, no doubt, the terminal charge appears to be a heavy one.

15,255. And occasionally on other goods for short distances?—Yes; in many cases unless a terminal charge were made, it would never be worth the while of a company to put stations at all at small places; in some cases the simple interest upon the outlay on goods stations and sidings unless a terminal charge were made would come to far more than the whole amount of the receipts from the traffic.

15,256. (*Mr. Horsfall.*) Do you not think it would be desirable to have a maximum toll fixed which would include all terminal charges?—I think you would find a great difficulty in that, because such a toll would be quite inapplicable to the case of long distances. I think the plan now adopted of making one rate of toll upon a line of railway and a separate charge for terminals is infinitely the best. If you take the case of a short-distance rate, and make it at all remunerative

so as to induce the company to carry the traffic at all, if you combine the two in one, you must make the maximum toll exceedingly high. Supposing the distance to be only six miles and the terminal charge was 2*s.* 6*d.*, and the charge by rail was 1*s.*, that, divided into a mileage rate of six miles, would make it 7*d.* per mile—a rate inapplicable for a long distance.

15,257. Do you see any objection to a fixed terminal charge?—None whatever; but the difficulty there again is that in all cases the maximum must be fixed with reference to the extreme case, otherwise you would inflict injustice. No doubt there is great difficulty in dong it, because without a maximum which would apply to all cases I do not think you would succeed in it.

15,258. That would be preferable to having cases taken to the Court of Common Pleas?—Of course that would be the only alternative; but taking the case of a terminal for London, we make a special exception in that case in fixing the maximum terminal rate, because it is quite clear that the terminal charge for London must of necessity be much higher than it would be in the country.

15,259. The railway companies having at present the power of deciding what is a reasonable charge, do you see any objection, if the parties sending the goods consider that the charge made is unreasonable, to their applying to the Board of Trade to appoint an arbitrator who shall decide whether it was or was not reasonable?—The difficulty would arise of getting an arbitrator who would understand all the questions. It is something like establishing a Court of Appeal. I do not know where the arbitrator is to be found who would be quite competent to go into all those questions unless you laid down some principle on which they are to be based.

15,260. But assuming such an arbitrator could be found, do you see any objection to that plan being adopted?—I hardly think that an arbitrator appointed by the Board of Trade would be able to settle those questions. If you could have any court (which does not exist, and I see great difficulty in framing the organization of such a court,) with a legal judge and assessors who understand the points, it might be done; but merely to leave such a question to be decided by an arbitrator to be appointed by the Board of Trade, would not be satisfactory, because I think the decisions would be various and not based upon any sound reasoning without you laid down some principle which was to govern them. You leave that question to an individual. I doubt whether that would be at all a politic thing to do.

15,261. Seeing that it is now left in the hands of railway companies to decide what is or what is not reasonable, do you think it is just to the public that they should have some appeal without the necessity of contesting it in the Court of Common Pleas, which is a very expensive process?—If the tribunal were one in which all parties could have confidence, then I should think so. But the difficulty I see is in the tribunal itself. If such a tribunal could be established, based upon the principle of a judge and two assessors who understood the nature of the questions which might be referred to them, it might be practicable. That would be something like what the Court of Common Pleas is now; but I doubt very much if that were the case whether the expense would be less than going to the Court of Common Pleas. I happen myself to be standing arbitrator in a great number of cases between railway companies for settling their disputes, and I never recommend arbitration in any case where it can be avoided.

15,262. But the case to which you allude of an arbitrator between different railway companies would involve much more extensive questions than the question to be decided, whether a specific charge was or was not reasonable, would it not?—I do not know that. I think many of the questions between railway companies are quite as easily settled as a question of that sort. I think that that would open a wide door for the examination of witnesses. It is a very difficult question to settle. I am not opposed to the tribunal, if I can see that it would be really an efficient one, and one in which all parties would have confidence.

15,263. And less costly?—I doubt exceedingly about the fact of its being less costly.

15,264. (*Capt. Galton.*) You would have such a tribunal, then, to decide all questions between the public and the railway companies?—Yes, I think if it could be so constituted; but I do not know whether any suggestion had been made of an efficient tribunal for that purpose. I do not think the questions between the public and the railway companies on those matters are often arising. If they do, they generally embrace some large question of principle, on which I believe, as at present constituted, the courts of law would be the best courts to submit them to.

15,265. (*Chairman.*) You see no objection to terminal charges being fixed if the maximum is sufficiently high?—None at all.

15,266. Do you think it would have very little effect?—Very little indeed, because you must fix a maximum which really would, in 99 cases out of 100, be more than the actual rate which is in practice charged. And whenever the companies are not charging their maximum rates the terminal question to the public becomes a very small matter. The general rates and the terminals are merged in the general charge.

15,267. (*Capt. Galton.*) Do you think the public would suffer by having a maximum fixed?—I do not think it would make the slightest alteration as regards the charges made by the railway companies.

15,268. (*Lord Stanley.*) You do not object to a maximum being fixed except in this way, you think it would be quite useless, because it would have to be put so high as to be inoperative?—Clearly.

15,269. (*Mr. Horsfall.*) Why do you think, in 99 cases out of 100, that it must necessarily be fixed at a higher rate?—Because, if you are going to fix a maximum, you must fix the terminal charge at such a rate as would meet all cases; to begin with, I take the question of a terminal for London. Supposing the maximum rate of the terminal in London was to be fixed, it would be double the amount that is now charged all through the country. The maximum gross rate which is charged particularly for long distances is in 99 cases out of 100 composed of a toll which is greatly within the maximum authorized by Parliament, and therefore the public really do not suffer by it now. In those cases the question is simply one as between railway companies when they come to divide the amount of their gross receipts.

15,270. (*Capt. Galton.*) Could you not fix the amount to be charged for London by the maximum amount for the country?—No; you must fix the maximum for the country. If you do separate them, and fix a maximum for the country, you must take into consideration those cases, of which there are a great number, which really demand the fullest amount. Supposing we were to fix it at 4*s.* or 3*s.* 6*d.*, which is what is now charged, this in innumerable instances is an amount which actually, taking the principle that I am suggesting, would be unremunerative on the actual capital expended. Taking the case of agricultural districts, where you have to provide accommodation for a small amount of traffic, (and you are to base your calculations upon that,) you must get the maximum amount which is now charged. I do not see that the public would gain anything at all by that.

15,271. (*Mr. Horsfall.*) But assuming that in some cases it was necessary to charge the maximum, it would not necessarily follow that the railway companies should always charge it?—Clearly not, therefore the public would gain no benefit from it. Where you fix a maximum charge I do not see that the public would really derive any benefit from it, because you must take an amount which would meet all cases.

15,272. (*Sir R. Hill.*) Might you not propose the ordinary maximum with specified exceptions?—You would find that a very complicated system.

T. E. Harrison, Esq.

22 Mar. 1866.

15,273. The exceptions being specified in the Act?—That is a general question, but the exceptions I am afraid would be legion, because it varies very much.

15,274. (*Chairman.*) Why should the terminal charges in London be so much higher, because you do not properly include under the terminal charges delivery?—No; but the cost of land is considered to be so immensely in excess of anything in the country, and the cost of providing accommodation in London being more than double what it would be in the country, it has been generally allowed amongst railway companies that they are entitled to it.

15,275. With respect to an interchange of traffic between different railways, has the tendency been latterly to give greater facilities to one another than they formerly did?—I think it has. There are no doubt exceptions, but the view of railway companies as to giving interchange of facilities is, I think, within the last five or six years completely changed. Many agreements have been entered into between railway companies which allow one company to have its own agents at the town of another, and to cart its own traffic, and also through booking and interchange of traffic. That I think may be stated to be a very vast improvement within the last 15 or 16 years.

15,276. (*Capt. Galton.*) Do you think any improvement could be made by legislative enactment in promoting an interchange of traffic and facilities?—I am afraid that when you attempt to drive a company there is no more difficult task. The agreements to which I have referred were made upon the basis of an interchange of traffic and other facilities one with the other.

15,277. Do you think a compulsory arbitration could be resorted to in such a case as that?—I do not think that would be found to work well in practice. I think the tendency decidedly is to go on increasing those facilities. Several cases have occurred to me in which I think the public have derived great advantage from them. Where running powers are granted by agreement between two railway companies, one running over the line of another, the general principle has been to exclude from that arrangement all questions of the conveyance of local traffic. That has been in some cases extended, and the convenience to the public of having the option of going by the trains of another company travelling over their system is exceedingly great, and although it was objected to strongly by companies formerly, I believe we are gradually getting to the point that they will not hesitate to do it. I believe the North-eastern were almost the first to adopt that plan. The North British Company, running over the North-eastern line from Hexham to Newcastle, could not by the agreement carry passengers from Hexham to Newcastle, although they stopped there, and although their trains were perhaps the best that were running, because they ran directly through. It was, however, such an obvious convenience to the public to travel by these trains that they have been allowed to do it, and not only that, but to stop at an intermediate station if they liked. That is an instance of the tendency to increase the facilities, and this is really the principle on which running powers between companies ought to be based. There are cases again where, unless such an arrangement was made, I think the public might be greatly disadvantaged, for instance, the North-eastern in a few months are going to run their own trains from London through to Edinburgh. Strictly according to the terms of running powers, the North-eastern Company running their trains from Berwick to Edinburgh would deprive the local public of the advantage which they now possess of going by the trains of the North British Company, who now work the traffic. It is quite obvious that the exercise of running powers in that case would be a disadvantage to the public, because the North British Company would never run express trains except in connexion with those which came from London. I have no doubt that the North British Company will exchange the same facilities with the North-eastern Company, and allow the public to have the advantage of all trains, just as they do now, though it is not provided for by any agreements.

15,278. (*Sir R. Hill.*) Companies discover that it is for their advantage to afford the public all reasonable facilities?—I think that is obviously the interest of the companies.

15,279. Some companies are slower than others in making that discovery?—I should be exceedingly glad to see that the feeling between railway companies was even better than it is now. The other day I was going down to Hastings, and I found there the inconvenience of what I am stating; they have a station at Hastings which is common to the Brighton Company and to the South-eastern, and they have a station at St. Leonard's which is the sole property of the South-eastern, and then out of St. Leonard's to the westward there is another station, which is the property of the Brighton Company. The central station at St. Leonard's is infinitely the most convenient, but although they have running powers over that line into the Hastings station, the South-eastern will not allow the Brighton Company to stop at the St. Leonard's station and put down or pick up a passenger, because it would enable them to compete for traffic to London. In order to prevent that competition to London, they are actually putting the whole of the rest of the travelling public upon the Brighton line to the inconvenience of getting out at the station at the west end of St. Leonard's, which is a mile and a half away from the centre of the town.

15,280. If those two companies were amalgamated, of course that difficulty would come to an end?—It would come entirely to an end.

15,281. I presume that is one of the advantages of an extended amalgamation?—That is one of the advantages of an extended amalgamation.

15,282. (*Capt. Galton.*) You do not think that any advantage would result from a compulsory arbitration for such a purpose?—I think it would be exceedingly difficult to enforce an arbitration in a question of that sort. I come back to the old question of what the court is that could enforce it. Unless you can lay down some substantial rules to guide it, an arbitration would be exceedingly difficult.

15,283. (*Chairman.*) Are agreements for mutual running power upon the increase among railway companies?—I think they are, and I must say that where they have been granted it has generally been the case, with few exceptions, that they are not exercised.

15,284. Do you mean where they have been granted by Act of Parliament?—No, where they have been granted by agreement; because where parties come to a mutual agreement there are always a large number of other things included in the agreement, and they generally come to an understanding, and do not exercise those running powers.

15,285. Do you think a universal grant of running powers between railway companies would be attended with mischief?—Certainly. I do not think it would be a practicable thing. Take such an instance as a crowded part of the North-western line, you could not grant to another company power to use all their stations. I am myself an advocate for granting running powers in all cases where the public necessity and convenience require it, and where you see that it can be done without danger.

15,286. (*Mr. Horsfall.*) From what you state I collect that you do not think that the convenience which is given by the railway companies by through carriages is attended with any loss to the railway companies themselves?—Quite clearly not. My own conviction is, that the more railway companies lay their heads together to interchange traffic as between themselves, the more will they benefit themselves and benefit the public. I am quite satisfied that that is the result as far as I have seen it in operation.

15,287. (*Chairman.*) Is there any considerable delay in the transmission of goods from one part of the country to another, owing to imperfect arrangements between the companies for forwarding goods?—I do not think there is. I think the great difficulty

that has arisen during the last year or two in the conveyance of goods has been more from the rapid increase of the traffic coming upon railway companies without their really having the means of sufficient siding accommodation for it.

15,288. In your opinion has the cost of working railways a tendency to increase or decrease ?—I think it has decidedly a tendency to increase.

15,289. What are the causes which lead to that ?—I think, in the first place, that the public continually demand more accommodation which the railway companies see it to be their interest to afford. The improvement both in the quality and in the size of all the locomotive engines, making them much more perfect in themselves, adds a great deal to the cost. If we take the rolling stock of the railways generally, and compare the carriage or waggon which is now in use with that which was in common use not more than 10 or 15 years ago, there is no comparison between them ; they are infinitely better in every way, and considerably dearer. Then with regard to the permanent way, the importance of having that of the best possible construction causes a considerable additional outlay. The cost of the permanent way, as now laid down, is at least 50 per cent. more expensive than what it was a few years ago. I am perfectly satisfied that those who live 10 or 20 years hence will see a vast improvement in the permanent way beyond what we now have. The whole tendency in every way is to increase the cost, but it frequently happens that the increased returns go on in quite as rapid a ratio.

15,290. On the whole you think it to be to the interest of the companies to incur those expenses which add to the cost of working the line ?—Most decidedly. I think the more perfect you can make the system in every way, both as to the amount of its accommodation and the nature of the stock, the more inducement you give the public to travel.

15,291. Is the proportion of the expense of working a line to the gross receipts increasing ?—I do not think it is in proportion to the gross receipts. One per cent., which is a small amount, must be the extent to which it has gone ; but if you take the actual cost in every way, such as wages and men, it is largely increasing in every department. Within the last two years the wages which railway companies pay to their labourers, mechanics, enginemen, firemen, and indeed every class, have been largely increased, and they are increasing now. That cannot be avoided, because they cannot get the men without.

15,292. Do you see any mode in which greater economy in working the line can be effected as regards the actual working ?—I do not think you can at all diminish the expense of working. I believe that the tendency is to make it more perfect, and, in doing so, to add to the cost. I believe that the more you place a railway company in the position of finding it to be to its interest to lay out its capital for that purpose the better ; they will make a much more perfect machine.

15,293. Do you think it is possible to introduce a system of running fewer carriages, so as to make the number of carriages more nearly in proportion to the number of passengers than is the case at present ?—I do not think you can do that.

15,294. Do you find that is a point on which the public is very sensitive ?—I think any limitation of that sort would be going in the wrong direction ; the tendency rather is to improve the accommodation than otherwise.

15,295. You have generally a large number of partially empty carriages running in every train, have you not ?—Yes ; but in the case of families who are travelling a long distance to adopt the plan which is sometimes adopted in the stations of London of not allowing any one to get into an empty carriage until all the other carriages are full, would not be at all consistent with the feelings of a party of three or four who might wish to go a long distance in a carriage by themselves.

15,296. (*Lord Stanley.*) In point of fact, do not first-class travellers generally seem to consider that they have a right to two places instead of one ?—No doubt. I do not think that it is at all the policy of railway companies to attempt to limit the accommodation of the travelling public.

T. E. Harrison, Esq.

22 Mar. 1866.

15,297. (*Sir R. Hill.*) But is not such an amount of accommodation quite inconsistent with very low fares ?—The very low fares of course would apply only to excursion trains, which principally consist of second and third class passengers ; I believe in those cases the railway companies are not so particular, and they do not mind packing them rather closer together.

15,298. It has been stated in evidence that on the average only about one-third of the seats in the train are occupied by passengers, is that the case on your line ?—Certainly not ; I should rather think it is the other way, and that there are about one-third unoccupied and two-thirds occupied. It is rarely the case that in a compartment of six not more than two passengers are admitted.

15,299. You do not consider it necessary to give such facilities to the public as so large a proportion of unoccupied seats as two to one ?—Oh, dear, no !

15,300. (*Chairman.*) Do you think that that estimate is undesirable with regard to first-class passengers ?—Even with regard to first-class passengers, I think the estimate of one-third occupied to two-thirds unoccupied is in excess of what my experience proves. There are cases of this sort ; take, for instance, local traffic, such as that between Sunderland and Newcastle, where the same number of carriages, except on Saturday, are run all through the day ; at particular times, that is, the business hours, those compartments may be nearly full, and at other periods they will be nearly empty, but still you could not make any change in that ; you count upon the number that may come at a particular time, and therefore in that case you are obliged to provide for the maximum amount. At certain times of the day you may run empty carriages, but I do not see how you are to remedy it.

15,301. Do you think the cost of working has been much increased by the sanctioning of lines intended to compete with one another ?—I think in many cases undoubtedly, and the effect has always been this, that where a line is granted for the purpose of competition they eventually come to some arrangement, and it becomes the property of the parent line, and unless the district itself, on its own merits, demands it, I certainly do not think that a line granted for the purpose of competition has in its effects ever been successful.

15,302. (*Mr. Gower.*) The public benefits till they come to such an arrangement ?—For a period ; it is a short one. The fare is reduced to 2*s.* for a few months, and then they come to the conclusion that they had much better lay their heads together and enter into an arrangement. There is not a single instance at the present moment when a line has been granted upon the ground of affording competition that that competition exists.

15,303. (*Sir R. Hill.*) Then the ability to reduce the fares is lessened ?—Clearly ; it is spending two capitals to do the work of one. I am quite clear if you want a cheap work, that you will do that work cheaper by one line than you will be able to do it by two. Take any two towns where there is a moderate amount of traffic, if that traffic is split up into two you will not have it so well done as you would if it were carried by one line, assuming always there are no other circumstances to induce the formation of the other line. Of course I do not for one moment say if the country requires another line that it should not be made, because it indirectly introduces competition ; I say quite the reverse, I say that you must let it go upon its own merits ; but to make a line solely for the purpose of competition, in every instance in which it has been tried is a failure.

T. E. Harrison, Esq.

22 Mar. 1866.

15,304. (*Chairman.*) Does not the competing line in every case serve a different district from what the original line does?—Not in every case.

15,305. Can you mention any case in which it does not?—You may take such a case as two or three lines going to Liverpool, where, undoubtedly, you serve a different district, but I know many cases in which lines have been projected, and I have seen some lately, in which literally there is not a single town to be accommodated which is not accommodated now, and where the sole ground upon which they proceed is the question of competition. Those are cases in which I think it is a fallacy to assume that competition is a ground alone for passing the line, but, as in the cases which you suggest, if there is a population to be served in the district through which such a line goes, I should never say stop that line because it indirectly produces competition. I think that would be quite a mistake.

15,306. Can you mention any two lines by which two different districts are not accommodated?—At the present moment I cannot.

15,307. (*Earl of Belmore.*) Is there not a district of country between Buxton and Manchester in which those circumstances exist?—That is a line belonging to the North-western and one belonging to the Midland. The object of that was rather a wider view than the question of mere competition to which I refer. That was an instance of a line with many miles of railways, as in the case of the Midland, without any means of access to the district of Manchester, and the North-western refused to book passengers over their system. That was rather an extreme case. I think the case which may perhaps answer the question which you have to put to me was a case which occurred last year of a line projected into the district of the North-eastern railway. Throughout its course there was not a single town that it touched that was not accommodated, it did not go through a single place that was not accommodated by the North-eastern, and the consequence was that the line did not pass. But it was done professedly for the purpose of making a competing line between Leeds and Scarborough.

15,308. (*Mr. Gower.*) Do you think that the Midland extension to Carlisle is a case in point?—That is before Parliament now, but according to my view of it it is a great pity to spend the large amount of money which they propose to do, when the two companies, if they could only lay their heads together, might accomplish everything that is required without spending one single farthing. It is a simple question of convenience, for that line does not accommodate one single town throughout its whole length which is not already accommodated. I hold that to be a useless waste of money; at the same time they cannot agree, and it is a great pity that they cannot.

15,309. (*Lord Stanley.*) Who is to stop a line of that kind being made; do you think that a committee of Parliament ought to interfere, and say to the intending shareholders, "You are going to throw away your "money, and therefore we will not allow you to make "your line."—I think that the committee would perhaps look to the necessities of the case, and if they found that there was a large traffic dependent on it, and a large accommodation to be gained by it, that they would pass the Bill. Of course I cannot say what are the views which committees do take when these questions come before them.

15,310. (*Capt. Galton.*) Would you alter the system of Parliamentary legislation so as to prevent this competition?—Clearly not, I do not see that you could do that. Of course committees vary in their views; some committees think competition a good thing, and others do not; I should not at all wish to alter that tribunal.

15,311. Would you lay down any rules for the guidance of committees?—I do not think I should.

15,312. You think that every project should be decided according to its own special circumstances?—I do not think you could lay down any rule. A line which is projected for the sole purpose of competition, where the existing means of competition are sufficient for the public, clearly is not a sound reason in itself for passing the line. If you say there is a district which has not the accommodation which it requires, and by passing that line you give the means of competition, then I hold that that has nothing whatever to do with the case, and that you ought to accommodate the district, although it may produce competition.

15,313. (*Mr. Gower.*) Is it not the fact that money is forthcoming to make a new line frequently because the existing accommodation is inadequate?—I do not think that at all. The question which you put as to money being forthcoming is a matter which is not always investigated by committees. In the case of an extensive line of railway which was projected last year, I was called upon to advise as to the desirability of taking it up. The promoters were asked if any agreement existed, and an agreement was put into my hands to examine, being the first of the sort that I had ever seen. The nature of that agreement was simply this: in the first place, it set forth that the first contracting parties were the engineer and the solicitor, and the second contracting party was the contractor himself; the contractor agreed to provide the deposit, for which he was to be paid 5 per cent., and which was to be repaid to him within six months after the passing of the Act. He was then to construct the work according to a schedule of prices, which was based upon cash prices, which schedule of prices, when I looked through it, appeared to me to vary from 30 to 50 per cent. above the ordinary prices at which the work could be let. The next clause was that if he was called upon to take shares in the undertaking in payment that the schedule of prices was to be varied according to the rate at which the shares were sold in the market. Therefore, if the shares were at 50 per cent. discount, and he was to take those shares, of course he got something in addition for his money; then if he found this capital he was to nominate the directors of the company in proportion. It was so absurd that I fancied it was an agreement standing by itself. I said to the engineer, "This is a most extraordinary sort of a thing." He said, "I can assure you this is a model agreement on "which all these lines now come before Parliament." I have very little doubt that such is the case. Of course I said to the parties who consulted me, "All "you have got to do is to say, unless that agreement is "put into the fire we will not enter into any negotia "tion with you; you ought not to touch it upon any "terms." It has just this effect, that it is a speculation between the contractor, the engineer, and the solicitor, and ten to one when the Bill is passed if the line ever is made. I know several lines at this moment which have been got up on the same principle, and which have no cash to go on with.

15,314. (*Sir R. Hill.*) Is not that the case with most of the projects now before Parliament?—With a great number of them. There was a case which came before a committee of the House of Commons a few days ago in which one of the directors of the company was examined as a witness. The company applied for an extension of their time, two years having expired from the date when they obtained their Act, and also for an extension of their line. But when this director was examined it appeared that he did not know where the money came from originally for the deposit; that he never attended at a board meeting; that he did not know whether they had got a single penny to go on with; and that he did not know where the money was to come from; and the committee refused to grant either an extension of the time or an extension of the line. I know many cases in which Bills have been passed within the last year or two in which the companies are very much in the same position.

15,315. (*Capt. Galton.*) Is it not sometimes to the advantage of the shareholders of a great company whose shares are at a large premium to extend their lines?—I think when a company is in a prosperous condition that they are very much more disposed to extend their lines than when they are not, certainly.

15,316. How would you remedy the state of things which you described just now, so as to prevent that sort

of speculating in new lines?—I do not think you can remedy it except by a strict investigation when these matters come before the committees as to the real state of the case.

15,317. As to how the deposit was paid?—I do not think it is quite creditable to English commercial fame to have railways projected in that manner.

15,318. (*Mr. Horsfall.*) Had the Bill to which you referred just now passed the referees?—It had not been opposed before the referees, and it therefore came before the committee. The referees do not go into the question of the mode of raising money; they merely enter into the question of engineering details. This came before a committee of the House of Commons.

15,319. (*Lord Stanley.*) Do you not think this is a kind of evil which will work its own cure? Will there not be an end to the supply of dupes in time?—I do not know as to that; the dupes only come afterwards. The original application as it is made now does not require to have enlisted any dupes at all in it.

15,320. (*Chairman.*) Must not the failure of those speculative lines sooner or later put a stop to this system?—I think it will in the end. I know an instance in which they were obliged to apply to Parliament to get relieved from the difficulties consequent upon a similar case in which they had obtained an Act of Parliament and the money had been withdrawn. A gentleman had given the necessary bond for the withdrawal of the money, and it was found that, being as he was in consequence of that bond a debtor of the Government, he could not sell a single bit of his estate or property. We put a clause in one of our Acts to relieve him of that difficulty. I think in the next few years there will be many cases of a similar character.

15,321. (*Earl of Belmore.*) Are not a great many of these lines which are made in the way that you have described promoted in order to be sold to the large companies?—Yes. If the large companies buy them they generally buy them at an immense additional cost, far beyond what they could have made them at if they originally applied for them themselves.

15,322. (*Sir R. Hill.*) You think such lines are promoted for the most part in order that they may be bought by existing companies?—That is so.

15,323. Generally speaking, have they been able to frighten the larger companies into purchasing them?—In many cases they have. They are generally laid out with a great deal of care in order to have two strings to their bow, so that it will be a line which will suit either one or other of the railway companies; and then they put a very good premium upon them. It is no doubt a very profitable thing to the promoters in many cases.

15,324. (*Mr. Gower.*) Is not the disposition on the part of the great companies to purchase these small lines decreasing?—I think it is. I think the North-western have come to the resolution that they will not touch one of them.

15,325. (*Sir R. Hill.*) That is one of the good results of amalgamation, is it not?—Yes.

15,326. (*Mr. Horsfall.*) And one of the good results of past experience?—Many of them are not paying at all. I know a case at the present moment of a line near Hull. It is not a competing line at all with the North-eastern Company; it is got up much in the same way; we are asking for powers to amalgamate with it, but on this basis, that we do not take any of its share responsibilities. I have no doubt the original shareholders will not get one single sixpence of their money back again.

15,327. (*Chairman.*) Do you think that fares now would in any cases be lower than they are if Parliament had not sanctioned competing lines?—In many cases I think they would. I think that the effect upon a railway company is this, the moment a company has got to be in a prosperous condition (and I can speak from positive experience of it), all questions as to a reduction of fares are treated by directors in a totally different view to what they are when a line is not paying. I happen to have been connected, as engineer and manager, with lines in all their different phases. In the case of a line that was not paying anything, I have always felt the greatest difficulty in getting what was almost an absolute necessity when questions arose as to the state of the rolling stock and the permanent way. I recollect some years ago having to apply for the relaying of a line of railway which I did not consider to be in a safe state. I had it urged upon me whether I could not say that it might not go on as it was for three months longer. That is just drawing the line to the nicest possible degree. I felt great responsibility in having to do it, but I was asked the question whether it would not be possible to defer it. Even with reference to the simple question of painting the carriages, and having them in a better state, it is always deferred when you come to a line which is in a bad condition to the very last moment. I suffered from that to an extent which it is almost impossible to describe, having been engineer and also manager of a line of railway some years ago in that condition. Then when you get to the next stage, viz., of a line improving, everything looks up, and every application you make is treated in a totally different manner. When you come to the ultimate stage, viz., of a line paying a good dividend (as I am happy to say is the case with the line for which I now act as engineer-in-chief), every application involving an outlay of money which comes before the directors is met in a totally different spirit. If it be a question of making the carriages of the best possible form in which they can be made you find no difficulty or objection to it; if it is a question of providing additional station accommodation they are always ready to meet it; if it is a question of fares, experience has shown me in the case I refer to that they have agreed to a very large reduction of fares, which for several years they have always said they could not afford to entertain. It is just the difference between being able to afford to do a thing and not being able to afford to do it. Therefore I hold very strongly to the opinion that if unnecessary lines are kept out of the field so as not to spend large capital, which in many cases is entirely unproductive, the tendency would be that which I have experienced myself, to reduce the fares, to give larger accommodation, and ultimately I believe to make a considerable reduction in the fares of every department of the railway.

15,328. (*Sir R. Hill.*) That is a reduction in the charges to the public generally?—Yes.

15,329. (*Mr. Gower.*) Are the rates on the Great Eastern higher than they are on the North-western?—They are.

15,330. Considerably?—They are considerably higher. The passenger fares are considerably higher. One cannot help seeing, although perhaps it is invidious to mention any particular railway company, that the Great Eastern itself is not a specimen which any one would like to take of a railway. I will go even further and take the Great Western; if you compare the present accommodation of the Great Western railway with what it was 10 or 15 years ago, it is most remarkable; take the condition of all their carriages, stations, and the punctuality with which their trains are worked, and compare that with what it was 10 or 15 years ago; it will be seen that they have been gradually going down hill, and getting worse and worse. I believe that is owing to the rigid economy which they are of necessity obliged to enforce in every department from the real necessities of their case.

15,331. (*Chairman.*) Does not the fear of competing lines receiving the sanction of Parliament often induce railway companies to reduce their fares;—I am not aware that it has. The only case in which I know of a positive reduction in railway fares being made, was in the case of the South-eastern when the London, Chatham, and Dover introduced their Bill. The London, Chatham, and Dover agreed that if they got their Bill, they would make some reduction in their fares, and that obliged the South-eastern to reduce theirs. But I do not know otherwise that it is so.

15,332. Did not the London and Brighton, a few years ago, offer to reduce their fares as an inducement to the Committee to throw out a projecting line, com-

T. E. Harrison, Esq.

22 Mar. 1866.

peting with them?—I do not know that they offered that to the committee; I know that they did reduce them. They consulted me upon it. My strong advice to them was to reduce their fares, and the result has been, that for the first two or three years they suffered considerably, but they have recouped themselves entirely, and I believe they are unanimously of opinion that it was the right course to take.

15,333. Was the reduction very considerable in that case?—I think it was nearly 30 per cent. It made a considerable change in their dividend for the time being.

15,334. (*Sir R. Hill.*) In that particular case the willingness of the company to reduce their fares, although it warded off competition for a time, has not prevented its reappearing, has it?—No, it has not.

15,335. A competing line is now before Parliament?—It is.

15,336. (*Chairman.*) Can you state any other causes which are leading in your opinion to an increased cost of working?—I think that to a certain extent the state of excitement, which exists with reference to all these new railway schemes, has undoubtedly been one of the causes which tends to raise the price of money. As far as all railway companies are concerned, the rate of interest at which they are borrowing money is increasing from year to year, and that helps to add to the cost; at the same time I am not aware that it can be avoided.

15,337. You have stated already that there has been a great change in public opinion with respect to amalgamation, and that the recent amalgamations have not been opposed?—They have not.

15,338. Do you think amalgamations have generally been to the advantage both of the public and the railway companies themselves?—I am quite satisfied that they have been of great advantage, as is proved from the development of traffic resulting from the large amalgamations. I particularly refer to that of our own district, the effect of which, beyond any question, has been to develop the traffic to an immense extent. Take the case of that most important district of Cleveland. We have been enabled to introduce coals into that district from three separate districts which before were all, when unamalgamated, acting entirely for their own interests. The coals from the three districts were taken to separate places, only one going to the Cleveland district; but now the whole three are open, and go there. I suggested the first amalgamation of the North-eastern Company in 1848, which was opposed at that time by every individual director of the three companies. I stood alone for a long time, until I got them by degrees to take the view I did; and from that time we have gone on amalgamating with other lines, and every fresh amalgamation has added to the development of our traffic. We have improved from being a non-paying line to paying six per cent. I am quite satisfied now, after several years' experience, of the benefit of amalgamation.

15,339. Have you generally found that the boards of management of the smaller railway companies are influenced by narrower views than those of the larger companies?—Beyond all question. Their minds are of course limited to their own immediate district, and they of necessity take quite a limited view of it.

15,340. Do you expect that amalgamations will proceed much further than they have hitherto done, and that any of the larger companies will amalgamate with one another?—I think so. I see some cases where amalgamations will be most beneficial to the railway companies and to the public. They are matters with which I am only concerned as a looker-on.

15,341. Do you see any limit at which it is desirable that amalgamations should be fixed?—I think that the districts would limit that. I do not think you can have much larger amalgamations. In the case of the North-eastern, which is perhaps one of the largest results of amalgamation that there is, I do not see that we can by any possibility extend it, that is, beneficially extend it. We have always adopted this principle, to improve all our internal communications as much as possible, and spend money in our own district whenever it is required; but on no account to extend ourselves into any other person's territory. We have acted upon that principle, I believe, most beneficially.

15,342. You do not think these large companies ever neglect the smaller branches of their system, as being comparatively unimportant?—I do not think they do.

15,343. (*Sir R. Hill.*) Is it not one of the advantages of amalgamation, that the amalgamated companies can employ officers of superior talent and experience?—No doubt; I do not think there is any point in railway management that admits of more improvement than the quality of the officers in the lower grades. I think that if railway companies were paying better than they have been paying, that we should introduce throughout the whole of our system a better class of men than we have at present; I refer to station masters and men of that sort; I think it is a great defect in many of our railways.

15,344. One advantage which the public would derive from the improved management of railways, consequent upon the extension of the principle of amalgamation, would be greater safety in travelling, would it not?—Yes; I think there is nothing more conducive to the safety of the railway than the perfection of all its parts. Whether you take it as a question of permanent way, of its rolling stock, or the extent of accommodation which you provide (and which involves a large amount of capital); all those are essential features in producing safety in railway travelling, and the more you can bear that in mind as a railway company the better.

15,345. What are the causes that have generally influenced companies in amalgamating with one another?—I think, in some cases, undoubtedly to avoid ruinous competition; and, in many cases, one great object has been the real question of an interchange of traffic, for the purpose of developing the resources of the district. I have mentioned already the case of a petition being signed in favour of an amalgamation by parties paying about 700,000*l.* in dues annually. The sole point on which they supported that amalgamation was, that when the companies were amalgamated they would be able to get coal and other things from districts which they were entirely shut out from, and the result has been to develop the traffic of the district considerably.

15,346. You are aware that amalgamation has proceeded to a comparatively small extent in Ireland; have you at all considered what have been the reasons which have prevented amalgamation in Ireland?—I have not. I have been over several of the Irish railways, but I can hardly give any opinion upon them. I see no reason whatever why the same principle which has worked so beneficially in England should not be applied to those lines in Ireland.

15,347. (*Lord Stanley.*) Do you see any natural obstacle to amalgamations taking place in Ireland, by the voluntary acts of the companies themselves, in the same way as the companies in England?—I do not know that there is any reason why they should not so amalgamate by voluntary arrangement. There are, generally, difficulties to deal with between the companies, and I have been called in to settle the points in dispute between them. I have found them, generally, pretty determined to fight it out to the last. I see no reason at all why they should not amalgamate in Ireland as they have done in England.

15,348. (*Chairman.*) Would you, under any circumstances, recommend compulsory amalgamation?—I do not think you could force an amalgamation. Generally between the companies the question is as to the terms; they admit that it is a good thing, but they generally break off upon some question of terms.

15,349. In those cases where you have been called in in Ireland, has failure often arisen from local interests rather than the companies'?—They were not questions of amalgamation, but questions as to joint stations, one being as to the station at Limerick. In the north of Ireland some questions arose as to working traffic over each other's line, which were settled by arbitration.

15,350. Have you found any difficulty from one set

of directors being interested in one route and another set of directors being interested in another route?—Cases of that kind have not arisen.

15,351. You are aware that it has been recommended in some quarters that railways should be purchased by the Government; have you taken that question into your consideration?—Yes, I have; but I think the answer to that is simply this, that if the Government were to manage the railways they must do it upon some fixed rule. It would be next to impossible for the Government to settle such questions as fixing rates and fares, that is to say, that the varying rates and the commercial views which must be taken of them would be quite incompatible with any system which Government could lay down. They would more tend to the French system of having a rigid mileage rate, which I am quite sure would be destructive of all the railway traffic. I do not see how it is possible for Government to carry on such business, which is getting more and more to be of a commercial character.

15,352. (*Lord Stanley.*) Putting aside the question of the actual purchase of railways by the State, do you think that any arrangement of this kind would be practicable, that Government should lend money to a railway company on lower terms than it could be obtained in the market, say at $3\frac{3}{4}$ per cent., or some such rate as that, making in return for the loan, a condition that the fares by that company shall be lowered to the extent of the temporary loss which would countervail the advantages derived from the loan?—I conceive there is no railway company that would not most readily accede to such a proposition. I think they would do so at once. That it should be a condition to the loan being made that the railway company should make such a reduction of fares as might be considered by the Government an equivalent grant, I think is a condition which no railway company would at all hesitate to accept.

15,353. The intention of such a loan being that the benefit should not accrue to the company directly, but that the company should be the means of distributing it to the public?—Clearly. I think such a proposition would meet with the universal approval of railway companies.

15,354. (*Earl of Belmore.*) How would you meet the difficulty that might arise if the reduction that you made caused an actual loss?—As I understood the proposition, it was this, that if you pay now 100,000*l.* a year for your borrowed money and the Government were to lend it to you for 75,000*l.*, you would have to make a reduction in the fares equivalent to the 25,000*l.* Of course doing it in that way the railway companies are recouped by the saving in interest.

15,355. But if you found that the effect of the reduction of fares was that you lost more than 25,000*l.*, would you not be obliged to raise the fares again?—I think that the proposition of the noble Lord is, that the two should be made to tally. There would be no difficulty at all in making a reduction which should be equivalent to the amount saved; but the question would really be whether the company would not by the additional traffic be recouped a portion of it.

15,356. (*Lord Stanley.*) Supposing such an offer were made for a limited term, say seven or ten years, do you think it not impossible that the company might regain at the expiration of that term all that it had lost by the reduction of fares irrespective of the saving upon the loan, and therefore it might be fair at the expiration of such term to terminate the bargain and the reduced fares might still continue?—Perhaps financially it would be attended with considerable difficulty, because many companies are borrowing to the extent of several millions; and if Government were to withdraw a large loan, and the companies were thrown upon the market to borrow that money it might put them into a position of considerable difficulty. But, as regards the principle, my views are that the companies will recoup themselves any reduction of fares within a given number of years, the difficulty always being this, that you cannot tell the extent to which that increase would have gone on irrespective of the reduction. With reference to population, we have been increasing at the rate of from 3 to $3\frac{1}{2}$ per cent. in the northern district. There may be some little difficulty in it, but otherwise I quite think the noble Lord's suggestion is one that will be at any rate gladly entertained, if not adopted, by the railway companies.

15,357. (*Mr. Gower.*) Would not the Government in that case have to consider what the reduction should be upon the different railways, and whether it should not vary according to the circumstances of each railway?—Clearly so. Supposing that you are going to reduce your fares to the extent of 25,000*l.* a year, there is no difficulty at all in taking the number of passengers that you are now conveying and seeing what reduction of fares would be equivalent to that. That would be a simple matter of calculation, and I think it would be perfectly easy to arrive at it.

15,358. (*Lord Stanley.*) Do you think that that might be made a progressive operation in this way: Supposing that the bargain was originally made for seven or ten years, and that at the end of that time the temporary loss had been recovered, would it be practicable for the Government to say, Now we will continue this loan to you for another period of ten years, but inasmuch as you have recovered from the effect of your former reduction of fares, we shall require you to make a further reduction?—In principle I should say that is quite correct; but it would be accompanied by a great deal of difficulty in ascertaining what the proportion was. In principle I think it is sound enough.

15,359. (*Chairman.*) If an advance such as has been suggested were made to the Great Eastern or the Great Western, which are not in a very prosperous state, upon the condition of lowering their fares, would it not indirectly compel all the other large companies to reduce their fares without having received any benefit?—In all cases in which they are going to competing places it would, undoubtedly.

15,360. If much lower fares than are now adopted were enforced on the Great Eastern or the Great Western, would not gradually all the railway companies feel the effect of that, and be obliged to reduce their fares?—Certainly. I understand the proposition to be, that if that were adopted as a principle, if it be open to one company Government would make it open to any which might require the boon.

15,361. The prosperous companies are able to borrow at present upon such terms that it would be hardly worth their while to accept any assistance from the Government, are they not?—I do not know that; the difference between $3\frac{3}{4}$ per cent. and $4\frac{3}{4}$ per cent. comes to a very large amount.

15,362. You think if the offer is made at all that it should be made to all the companies?—I think you can hardly pick out a particular company to make a reduction of their fares in return for a loan, because it might act as a great obstacle to some of the other companies.

15,363. (*Sir R. Hill.*) Should not one condition be that the company to whom the loan is granted is in such a state as to make the repayment secure? If so the probability is that the prosperous companies would be the first to avail themselves of the offer?—Yes; I think if Government were going to lend money that they would take care that they had abundant security before doing so.

15,364. (*Lord Stanley.*) I presume we may take it to be the case with regard to any large company in England, the security of the capital invested is sufficient to guarantee the interest upon such a loan as would be required?—Of course it depends upon the nature of the securities. I am not prepared to say that with regard to every individual company I should go the length of saying that it was perfectly secure; but, as a rule, making certain exceptions to it, I think it would be perfectly secure.

15,365. At any rate there would be no great difficulty in referring that matter to some authority, not directly connected with the Treasury, who could decide whether the security was sufficient?—There

T. E. Harrison, Esq.

22 Mar. 1866.

would be no difficulty in ascertaining the value of the security.

15,366. (*Earl of Belmore.*) If the Government were to advance money to any great extent, as has been suggested, of course if they have not got the money they would have to borrow it: do you think they would be able to borrow the large sum of money which would be necessary to pay all the debts of all the companies in the way suggested by Lord Stanley?—I do not think they would. If the Government had to borrow the large sum necessary for all the railway companies it would have the effect of raising the rate of interest to the Government.

15,367. (*Sir R. Hill.*) If Government advanced money to any company, the money so advanced would be employed in paying off debentures and so forth, would it not?—Clearly.

15,368. Then that would not increase the demand for money in the market?—It would increase the demand for cheap money, because if the Government are lending the money cheaply, they must borrow it cheaply.

15,369. (*Chairman.*) Do you think that the North-eastern, if they had an opportunity of borrowing from the Government at $3\frac{3}{4}$ per cent., would avail themselves of that, it being understood that they reduced their fares in proportion?—I should say certainly, that would be my view of it.

15,370. (*Mr. Gower.*) Would you cause them to reduce their fares proportionately to the advantage that they gained from the loan of the Government?—It is part of the suggestion that Lord Stanley has made, that there should be a calculation made of an equivalent reduction.

15,371. (*Sir R. Hill.*) The companies, I presume, would be willing to engage to make such a reduction of their fares as would not produce a loss exceeding the savings effected by the Government loans?—That is the proposition.

15,372. Seeing that there is a tendency wherever a reduction of fares is made to recoup the company by an increase of traffic, if for any reason the North-eastern were willing to make such a reduction as would lessen their net revenue, say to the extent of 25,000*l.* a year, the reduction made would be more than in proportion to the saving effected, would it not?—I understand the proposition to be that it is to be in proportion to the saving effected.

15,373. Would not the companies be able and willing to make a reduction which would, in proportion, be greater than that of the saving in interest?—I think the two points to consider would be the period for which the money was lent, and the company would then have to assume this, that at the expiration of that period they could not raise their fares again permanently, and they would also have to consider that at the end of that period they would have to borrow the money at a higher rate of interest. Therefore, the question would depend upon the fixed period for which the Government lent it. Ten years might possibly be rather a short period, because it would make a permanent reduction of the rates and fares; but, generally, the principle is one that might be worked out advantageously.

15,374. (*Earl of Belmore.*) If the Government were to lend money in that manner, and at such a rate of interest as has been suggested, do you not think it would be proper for the companies to provide a sinking fund for a given number of years?—Yes; I think it would.

15,375. (*Sir R. Hill.*) If the principle were adopted there would be no great difficulty in arranging the details, so as to secure Government on the one hand, and some advantages to the public on the other?—I do not think the details would be a matter of difficulty if the principle were adopted.

15,376. (*Chairman.*) You do not think having to provide a sinking fund would deter the railway companies from accepting such assistance?—I do not know that it would. Of course the saving would be so much less in that case because the reduction would be less.

15,377. (*Sir R. Hill.*) The effect would be that the company must then issue debentures from time to time?—Yes.

15,378. (*Mr. Gower.*) Would you propose that Government should lend to new projects in the same way?—No; I do not see that at all. I do not think they should lend to new projects, because they are clearly speculative, and the Government could not be at all secure that they would have any dividend for their outlay.

15,379. Supposing the Goverment were satisfied that the new project was a well founded project, do you see any objection to their lending money in such a case?—If they could satisfy themselves I should not. But if you apply the principle in one case you must apply it in all. I think it is a difficult thing in the case of new projects to know what the result will be. At the present time I am engineer to many lines which we have before Parliament as a large company. We are projecting them, because we believe there is a demand for them, and having regard to the benefit of the public we are justified and called upon to do so; but I am quite satisfied that several of those projects which we have this year will not directly pay to us more than from 2 to $2\frac{1}{2}$ per cent. I believe indirectly they may pay 4 per cent., but directly I am quite satisfied that they will not pay more than from 2 to $2\frac{1}{2}$ per cent, but with regard to those lines which are in the hands of independent companies it is quite impossible to say that there would be any security for the loan.

15,380. (*Sir R. Hill.*) Have you considered the question of how much the value of the property of the country has been increased by the construction of railways?—I cannot give any calculation of the increased value of it, but as a matter of fact, particularly in all cases where you are near a station in large towns, the value of property increases to an immense extent, and to agricultural lands the convenience is very great, but I am not able to say to what extent an actual increase in the value has taken place.

15,381. Can you give it within certain limits?—I am afraid I hardly can. I know many cases in which near railway stations land has more than doubled in value. That would not be a rule applicable in all cases.

15,382. That would be building land, I presume?—Land which has become building land in consequence. If a railway is taken through a large district, having regard to the facilities that it affords for the establishment of manufactories, it increases immensely the value of land.

15,383. You cannot give us any information as to the increased value of agricultural land by the construction of railways?—I have no data on which I could give anything that would fairly represent the value; it would be nothing but opinion, which, of course, is of no use.

15,384. Can you give the Commission any information as to the economy or otherwise of constructing very narrow gauge lines in districts where the traffic is small?—I have seen the most perfect narrow gauge line in Wales, the one which runs up to the slate quarries. I travelled on it two years ago with Lord Palmerston. It was last September twelvemonth. It is a narrow-gauge line from his own slate quarries.

15,385. What is the width?—It is only about 2 feet 6 inches wide.

15,386. Do they carry passengers on it as well as slate?—Yes; you sit back to back, and are strapped on so that you cannot fall off. It is not a kind of line that would be applicable generally. There is this difficulty that a transhipping is required when you come to change the gauge. It goes direct down to Port Maddock, where the slates are shipped. I do not think that a system of cheap lines like that could be made applicable to the country generally. The subject was debated at the Institution of Civil Engineers, and I think the general conclusion was, that it was a system which could not be generally adopted.

15,387. Is the cost of construction much less than

that of the ordinary gauge?—It is less, but not so much less as some people would think.

15,388. May there not be districts where the traffic would support one and not the other?—Yes, certainly, but I think they are quite exceptional.

15,389. In such a district it would be better, probably, to have a very narrow gauge line than none at all?—Yes; I am afraid that in those districts the difference between the two would hardly make the one a paying line and the other not. In that particular case it was a paying line before when it was worked by horses; but since it has been worked by these little locomotive engines, carrying passengers, I believe it has turned out to be a non-paying line.

15,390. Are you aware what has been done in some parts of our Indian empire in the construction of narrow gauge lines?—Yes.

15,391. They are reported to have been made at a very low cost, do you know how far those reports are correct?—I believe they are quite correct. They are called the Tramway Railway Company of India.

15,392. The company is a prosperous one, is it not?—Yes.

15,393. Narrow-gauge lines have also been made in some parts of Australia, I think?—That is not at all unlikely.

15,394. And with success, according to report?—One of the great expenses that would be applicable to all lines of railway according to the present regulations, is that they do not allow them, unless in quite exceptional cases, to cross over the public highways upon a level. That would be just as applicable to that little narrow-gauge line as to any other. If you really want a cheap line of the nature that you describe, they ought in the first place to get rid of that prejudice in such cases of crossing roads upon a level. They might run as nearly as possible upon the surface, adopting steeper gradients, and then the mere difference between the broad and the narrow gauge is not so large an expense as you imagine.

15,395. Of course, the narrower the gauge the sharper the curve?—We can make curves now as sharp as we like. One of the improvements which has been effected in connexion with locomotive steam engines is the radial axle box, an invention of Mr. Adams. They are now running locomotive engines on the Great Northern railway, which run from Hitchin over the Metropolitan line into the city; they will travel with perfect safety round curves of three chains' radius, and the carriages are constructed in a similar manner.

15,396. Have those engines eight wheels?—Six wheels, or four wheels, or some have eight wheels. It is a very ingenious arrangement.

15,397. Is the speed kept up?—Yes, with perfect safety.

15,398. Then it is not necessary to have a very narrow gauge in order to enable an engine to pass sharp curves?—No.

15,399. Is anything gained as regards the gradients? Are gradients more manageable with a very narrow gauge than with the ordinary gauge?—No; I should say, if anything, steep gradients would be better overcome by the broad than the extreme narrow gauge, but with regard to such a line as you are suggesting, the question of the gradient would be comparatively unimportant, because it might be in the first place a line of small traffic, or else it would justify a larger expenditure not having a small traffic, but the locomotive engines are so constructed that we can work them over gradients of 1 in 50 with perfect ease, and even less in many cases, and with sharper curves.

15,400. Suppose the object be to construct a very inexpensive line, say in an agricultural district, I understand you to say that considerable economy would result if the line crossed the roads on a level?—Yes.

15,401. Would you by that means avoid the construction of bridges?—Yes. If lines could be made at 4,000*l.* a mile, or a little more than that, I think there are many cases in which for a small traffic they would pay well.

15,402. Do you think that lines might be made with the ordinary gauge at 4,000*l.* per mile?—The cheapest line I ever constructed was one from Thirsk to Malton under favourable circumstances. Before the construction of it all the landowners, with two or three exceptions, agreed to give their land at 60*l.* an acre, including tenants' damages and everything, and the cost of that line when completed, its length being $22\frac{1}{2}$ miles, was under 100,000*l.* The stations and everything else were done very cheaply.

15,403. Did that include engines and carriages?—No, that was the mere cost of the line itself ready for working. In that case the whole of the roads were crossed on the level. I do not think there are more than three bridges throughout the whole length.

15,404. Did the sum you name include engineering, Parliamentary expenses, and so on?—It included everything; it was completed for that. It was a line in which the late Earl of Carlisle took a great interest. He was mainly instrumental in getting all the landowners (he setting the example) to take a low rate per acre for their land. That was the actual cost of that line, and having cost the sum which I have mentioned, it now pays about 4 per cent., not more.

15,405. Can you tell what would be the further cost of the necessary rolling stock of a line for small traffic?—I can give you a rule for that. The result of the experience of a great number of railways in the kingdom is simply this, that the cost of rolling stock for working the line is just equal to the gross annual amount of the traffic. Suppose a line is earning 300,000*l.* a year, you must have rolling stock equal to 300,000*l.*

15,406. You must expend one year's gross revenue in rolling stock?—Yes; that has been pretty well established by a comparison of the experience of all the railways.

15,407. That applies to a line of very small traffic?—I do not think that any line of such small traffic could afford to find its own rolling stock. We must assume that such a line would have to be worked by the parent line that it joined.

15,408. The probability is, that such lines would be parts of an extended system, and, therefore, might be worked by some extension of the stock of the parent company?—Yes.

15,409. Would your rule apply to such an arrangement as that?—I think it would.

15,410. (*Chairman.*) Does your rule apply to mineral traffic as well as passenger and goods traffic? I take the line generally. It applies to the whole system of the North-eastern Company. I took out that information some time ago for nearly all the large railways.

15,411. A great deal must depend, must it not, on whether the railway companies find their own waggons for the mineral traffic, or not?—Of course, that is assuming that they found the whole.

15,412. The general rule, is not to find waggons for mineral traffic, I believe?—That is the general rule. In the case of the North-eastern we find waggons for everything. The Great Northern find the bulk of their waggons for their mineral traffic. The Midland do not, and the North-western do not.

The witness withdrew.

Adjourned till Friday, 13th of April, at 12 o'clock.

Friday, 13th April 1866.

PRESENT:

The Hon. E. F. Leveson Gower, M.P.	Capt. Douglas Galton, R.E., C.B., F.R.S.
Sir Rowland Hill, K.C.B., F.R.S.	E. T. Hamilton, Esq., M.P.
T. B. Horsfall, Esq., M.P.	J. R. M'Clean, Esq., Pres. Inst. C.E.
Geo. Carr Glyn, Esq., M.P.	William Pole, F.R.S., *Secretary.*

The Right Hon. THE EARL OF BELMORE in the Chair.

Mr. F. Wragge.

13 April 1866.

Mr. Frederick Wragge examined.

15,413. (*Chairman.*) I believe you are commercial manager of Earl Granville's Shelton collieries and iron works in North Staffordshire, chairman of the North Staffordshire Coal and Iron Masters' Association, and formerly a manager of goods and mineral traffic on one of the great English railways?—Yes.

15,414. What railway were you the manager of?—I was formerly one of the managers of the goods and mineral traffic on the Midland Railway.

15,415. Will you favour the Commission with your opinions and the result of your experience with regard to the charges which railway companies may legally make in respect of the conveyance of goods and mineral traffic?—I wish to state, in the first place, that in my opinion the charges which railway companies may legally make are not defined with anything like sufficient exactitude and clearness. Of course, in saying that I do not presume to define to the members of the Commission to what extent those charges are clearly made out in their Acts of Parliament; but what I wish to state is that in practice the trader finds it very difficult indeed to ascertain what the legal charges are. The charges which many of the great railway companies claim to have a right to make are authorized by various Acts of Parliament, and it would involve an examination of all those Acts to ascertain what their legal charges are. In addition to that the railway companies claim to interpret those clauses of their Acts which relate to tolls and other charges according to their own view of the case. I can give an instance in illustration of that which I know to have occurred. The railway company were entitled by their Act of Parliament to charge for a class of goods which includes iron ore, pig iron, ironstone, and bricks for toll $\frac{3}{4}d.$ per ton per mile; for the use of waggons to convey the traffic, $\frac{1}{2}d.$ per ton per mile; and for locomotive power, $1d.$ per ton per mile; making a total of $2\frac{1}{4}d.$ per ton per mile. But there is a clause in their Act of Parliament to the effect that the maximum charge which shall be made by the company in cases where they find waggons and also locomotive power, and which charge shall include every expense incidental to the conveyance of the traffic, except loading and unloading, shall not exceed for this same traffic $1\frac{1}{4}d.$ per ton per mile. The railway company in making their charge claim to add together the three separate charges, making $2\frac{1}{4}d.$ per ton per mile; and they say that they are not bound by what is called the maximum clause, which would only entitle them to charge $1\frac{1}{4}d.$ per ton per mile. In addition to charging $2\frac{1}{4}d.$ per ton per mile they claimed to charge what they called a terminal charge, but in this case they perform no service such as loading or unloading. The point where the traffic arose being a place from which they expected to have traffic, they formed of course a siding or side road on which the waggons might stand to be loaded; and the place of destination of the traffic being a place where they also expected to have traffic, they formed a siding there on which waggons might stand for the purpose of being unloaded; they also convey the traffic from the one point to the other, but they make the trader a charge for siding dues. When they are asked to explain that, they say that it is for the use of their sidings; but the trader replies that he does not want their sidings; he merely wishes to have the traffic conveyed to its place of destination in order that he may unload it, and take it away. Then they say they cannot leave it on the main line to be unloaded, but they must place it on a siding, because it would not be safe for them to block up their line and leave a truck of goods until the trader unloads it; but the trader rejoins, and I think we have reason on our side, that it is not for the trader's accommodation that this waggon is put on a siding. It would be a matter of indifference to him where it stood when he unloaded it; but it is essential to the act of conveying the traffic from one point to another that they should at its place of destination put it off their main line. That is a case in which a railway company took upon themselves to interpret the powers of their Act of Parliament as to charges in a manner which seems to the traders of the district unreasonable; and in this particular case the trader consulted his solicitor as to whether the charge was legal, and whether he could resist it; but he was advised that the state of the law with regard to the charges which a railway company could or could not legally make was so uncertain that it was not desirable for him to resort to a court of law upon the subject, and that he had better make the best terms he could with the company and pay their charge. That is a case which actually arose. Then with regard to the charge of terminals by railway companies in particular, I wish to be allowed to mention that those charges are constantly made where the company in point of fact perform no service whatever beyond the conveyance of the traffic. They do nothing but what the Legislature must have contemplated that they would have to do when they fixed the charges which they were entitled to make, because the services which they perform are essential to the act of conveyance. They could not convey the traffic from A. to B. without performing those services. It seems to me and those whom I represent, that in cases of that kind, where no service is performed, it would be just as reasonable for a railway company to claim to make a terminal charge on passengers (for they really perform no greater service in the one case than they do in the other), and instead of calling it siding dues, I suppose they would call it platform dues. It is a fact which I know, having been a railway manager myself, that railway companies do make charges for traffic without special reference to the powers which they have by Act of Parliament. They consider that it is improbable that the charges they make will be called in question, and that it is very unlikely that any man will come forward as the champion of the trade to fight a railway company in a court of law, and they have it in their power to deter him from taking any hostile step against them, and in point of fact, in the few instances in which the charges they make are seriously called in question, they generally manage to arrange that it shall not come into a court of law.

15,416. (*Mr. Horsfall.*) Are you speaking of railway companies in general, or of any special railway company?—I am speaking of the railway companies whose practice I am acquainted with. I do not wish to specify them. I am not making any complaint against any particular railway company; but I believe the practice which I am alluding to fairly represents the general practice of railway companies.

15,417. (*Mr. Glyn.*) Then I understand your view to be that they charge more than they are legally entitled to charge?—I believe they do.

15,418. Do you know an instance of that yourself?—Yes; the case I have quoted seems to me to be a charge of that character. In that case I was, as I

have said, advised that the law was in so uncertain a state that it would be very undesirable to contest it.

15,419. (*Mr. Hamilton.*) What railway company did that apply to?—I do not wish to be considered as making a complaint against any particular railway company, but merely as giving an instance in illustration of what I mean, and therefore I would rather not give the name of the railway company.

15,420. (*Mr. L. Gower.*) You merely adduced that as an illustration of what you meant?—Precisely.

15,421. (*Mr. Glyn.*) If I collect rightly, the lawyer with whom you advised did not say that the charge was illegal, but he only said that the law was in a doubtful state?—He said that the law was in so uncertain a state with regard to the charges which railway companies generally make, that he would not advise the matter to be contested.

15,422. Without going into the particulars, can you mention whether it was for a long distance or for a short distance?—This particular case was on a short distance, three-quarters of a mile, which they charged as six miles.

15,423. Under their six mile clause?—Yes; adding together the three charges, without reference at all to the maximum clause.

15,424. (*Mr. Horsfall.*) They made a siding charge for which they rendered no service?—They did.

15,425. (*Mr. Glyn.*) What do you refer to when you state that they added together the three charges?—The toll, the charge for the waggons, and the charge for the locomotive power; and then there was the terminal, making the fourth charge.

15,426. (*Sir R. Hill.*) Perhaps you would like to modify your statement; as it stands it is in effect a charge that the generality of railway companies act illegally?—I think I said that I used it as an illustration of what I meant when I made the general allegation that the railway companies did charge more than they were authorized to do by their Acts of Parliament, and the traders find it very difficult indeed, even with legal assistance, to ascertain whether they would be likely to succeed in contesting those charges.

15,427. (*Mr. Glyn.*) Can you give the exact figures of this charge without mentioning any names?—The distance was three-quarters of a mile. They charged six miles at $\frac{3}{4}d.$ for toll, six miles at $\frac{1}{2}d.$ for carriages, and six miles at $1d.$ for locomotive power, which made $1s.$ $1\frac{1}{2}d.$

15,428. Was that for the conveyance of iron?—No; it was for the conveyance of bricks. Then they added $2\frac{1}{2}d.$ for siding dues, making $1s.$ $4d.$ per ton for the conveyance of bricks for three-quarters of a mile.

15,429. (*Chairman.*) Is not the maximum charge for each of these services fixed by Act of Parliament, supposing them to be severally performed, that is to say, where haulage is provided, where locomotive power is provided, and where there are sidings?—The maximum rates for toll, carriages, and locomotive power are fixed by Act of Parliament in what is called the maximum clause; but the company contended that they were not bound by that clause in cases where they were not common carriers.

15,430. Then it is contended that in this particular case they were not common carriers?—Just so.

15,431. (*Mr. Glyn.*) According to your statement and figures they appear to have charged more than the short distance clause?—They added $2\frac{1}{2}d.$ to make it even money.

15,432. (*Mr. Hamilton.*) How much did they exceed their maximum legal charge?—They exceeded their maximum legal charge according to the Act of Parliament by $8\frac{1}{2}d.$ per ton, being more than double.

15,433. Under what heads did the excess occur?—It occurred by adding together the separate charges for toll, carriages, and locomotive power, instead of charging the maximum rate which the Act of Parliament says they may charge for everything, including all the expenses incidental to conveyance, excepting loading and unloading; and as they did not load or unload, I take the rate in the maximum clause to be the rate which they ought to have charged.

15,434. (*Capt. Galton.*) You do not contend that they were not entitled to charge six miles?—No, I do not intend that for a moment.

15,435. (*Chairman.*) But if they were not entitled to charge for all of these things separately, what was the object of putting these charges for these services separately in the Bill?—Because in some cases traders find their own carriages, and I have no doubt when these toll clauses were framed it was contemplated by the Legislature that some traders might find their own locomotive power; therefore the items were put separately where they perform only one or two of those services; but there is a general clause afterwards, that when they perform the whole of those services they shall not charge for the whole more than so much.

15,436. (*Mr. Hamilton.*) Will you read those words?—"Provided always, and be it enacted, that "the maximum rate of charge to be made by the "company for the conveyance of passengers upon the "said railway, including the tolls for the use of the "railway, and of carriages and locomotive power, and "every other expense incidental to such conveyance "shall not exceed," and then follows a list of rates for passengers. "And with respect to the conveyance of "goods the maximum rates of charge, including the "tolls for the use of the railway, and of waggons or "trucks and locomotive power, and every expense "incidental to such conveyance, except loading and "unloading, shall not exceed the sums following; "For all coals, clay, bricks, ironstone, pig iron, the "sum of one penny farthing per ton per mile."

15,437. (*Mr. Glyn.*) When you represented that to the company did they not at once admit that they had no power to exceed that charge?—They stated that the maximum clause did not govern them in cases where they were not common carriers, and they thought proper to say that they were not common carriers, although on the other hand, in some cases, they say they are common carriers.

15,438. How was it settled eventually; did you pay the full charge, or did you pay the charge which you contend is the proper charge?—We paid something between the two; there was a compromise; they took something off; but we still paid more than we thought they had a right to charge.

15,439. (*Chairman.*) This is rather a question of the construction of an Act of Parliament than of the charges which may legally be made being settled by legislation or otherwise?—Yes. I am not complaining of the charges which they might legally make; but I wish to illustrate the difficulty which the trader finds in ascertaining what charges a railway company may legally make.

15,440. (*Mr. Hamilton.*) From the wording of the clause it was open to them to contend that they would either act as common carriers or as mere railway toll takers?—Precisely; and they elect to do one or the other just as it answers their purpose best for the sake of the argument in hand. Sometimes they say we are common carriers, and at other times they say we are not common carriers.

15,441. Your complaint arises out of the uncertainty of the words of the Act of Parliament?—Yes, or rather from their interpretation of the Act of Parliament.

15,442. (*Mr. Glyn.*) Do you apply the observation generally, that it has been done by other companies, or do you restrict it to one particular company?—I believe it is done by all companies.

15,443. Do you believe that they sometimes say that they are not common carriers?—Yes, to the best of my knowledge, speaking from the experience which I have had of other companies. I am not prepared to give instances; but for the purpose of giving the Commission the best information I can from the traders' point of view upon this question,

Mr. F. Wragge.

13 April 1866.

I believe that it is done regularly and generally by all railway companies.

15,444. (*Mr. Horsfall.*) Do you think that the case would in some degree be met by the publication of the maximum tolls and terminal charges at each station?—I do not think it would be met by that. I think that the remedy would be to have the charges which railway companies may legally make more clearly defined by General Act of Parliament. It is a great hindrance and delay to traders not to be able, by referring to some Act of Parliament or some public document, to ascertain what a company or companies may legally charge them as their maximum rate for traffic between two given points. If a customer comes to me to ask the price of iron delivered at such and such a station, I cannot tell him until I have opened communications with the railway companies, and until a delay has occurred, which perhaps loses me the customer. I cannot by referring to any public document ascertain what is the highest charge they can make. If I could do that I could then quote a price for iron, which would make me safe. If I could get it done for less by agreement with the company well and good; but I cannot at present ascertain the maximum charge which may be made by railway companies for the conveyance of coal or iron between any two given places or to any station where I wish to sell it delivered. I think that if the charges which railway companies may legally make were more clearly defined, say by a General Act of Parliament, and if the cases in which they may charge terminals were also defined, and what were the maximum charges which they might make for terminals under the circumstances which occur, three or four variations of circumstances would meet the whole case. I think it would also be very desirable that the charges which railway companies may legally make should be made uniformly. I do not see why there should be a different toll clause for every separate railway. The maximum charges which all railway companies in England may make should be in point of fact under a General Act of Parliament. It would be very much more simple; it would enable every one more easily to ascertain what charges they were subject to on any railway in the whole country, and I think both in the interests of the railway companies and of the public that it would be a very great improvement.

15,445. Do you think that a company whose railway costs 50,000*l.* a mile to construct should not have power to charge higher rates than a company whose railway costs only from 5,000*l.* to 10,000*l.* a mile to construct?—I think not in the public interest. I think that they ought not to have that power. Of course they would know before they undertook the construction of the railway what was the law.

15,446. Does it not appear clear to you that in that case the railway which is very cheaply constructed must derive a very large profit, or the railway which has cost the larger sum in constructing must be losing money by their traffic?—Yes, I admit that. I wish it to be understood distinctly that I am speaking from the traders' point of view and from the public point of view. I am not speaking from the companies' point of view. They might argue in that way, but, speaking from the traders' point of view, I believe that the balance of the public advantage and the public convenience would be on the side of having uniform charges on all the railways of the country.

15,447. (*Mr. Hamilton.*) That is assuming that the public get the same amount of railway communication that they get now?—Yes, I am speaking of the railways which are already in existence.

15,448. If you imposed a condition on railway companies which would prevent them from carrying their traffic at a profitable rate, do you think it likely that railways would be made?—I should not think there would be any difficulty arising out of that, but of course that is mere opinion.

15,449. (*Sir R. Hill.*) Does not the success of a railway depend quite as much upon the amount of traffic as upon the charge per ton per mile?—More. I should say that railways which are worked most profitably are those which, as a rule, carry the largest quantities at the most reasonable rates.

15,450. Are not those as a rule the expensive lines?—I believe they are in many cases.

15,451. Supposing the Government were to grant a higher maximum as regards the more costly lines, is it not highly probable that it would not be to the interest of the companies holding those lines to charge the maximum rates?—I think it is highly probable.

15,452. Do you know any company that does ordinarily charge its maximum rates?—I know cases in which companies, in order to develop the traffic which they are well laid out to secure, charge less than their maximum rates, and find it profitable to do so.

15,453. Does a company take into consideration the cost of the line in the determining their charges?—I think not.

15,454. Would it not be a mistake if they did take into consideration the cost of their line in determining their charges?—Yes, I think it would, because the amount of traffic they get depends upon the charges they make.

15,455. The cost of the line is a very important point for consideration before the line is made, is it not?—Certainly.

15,456. But not after?—I think not after.

15,457. (*Mr. Hamilton.*) But they take into consideration, do they not, whether a small traffic at a high charge or a large traffic at a small charge is most profitable to the company?—The best managed railways in the kingdom take that into consideration, and give moderate charges and facilities for large quantities of traffic to the traders and to the public.

15,458. Do you go the length of expressing it as your opinion that a uniform mileage rate throughout the kingdom would be desirable?—Yes, I do.

15,459. (*Sir R. Hill.*) You mean a uniform maximum mileage rate?—Yes, a uniform maximum mileage rate would not prevent railway companies by agreement from carrying for less in order to develop or encourage traffic. I believe a uniform maximum charge to be highly desirable.

15,460. (*Mr. Glyn.*) Is there any great variation between the charges of the different railways throughout the country? I am aware that there are some, but are the instances numerous?—I believe they are very numerous, but I am not prepared to say whether they are great.

15,461. (*Chairman.*) To go back for a moment to the case you mentioned just now, I understood you to say that you could not ascertain the highest charge that could possibly be made to you in any given case. What prevents you from ascertaining that highest charge I understand is, that you cannot tell whether the company intend to act as toll takers or as common carriers; is not that so?—Yes.

15,462. That being so, is not what you want rather that the law should be altered in such a way as to enable you to know at once if possible whether the company could in any particular case exercise the option of acting as common carriers or not?—Yes, you have correctly stated what I mean; but in addition to that a difficulty arises from the fact that companies claim to make customers "reasonable charges," the authority for which is not to be found in their Acts of Parliament to the best of my belief, and as I have been advised, and what I want is to have the charges defined which a company may make for performing all the services which they are called upon to perform for the public.

15,463. (*Mr. Glyn.*) Does not the term "reasonable "charges" apply only to the question of terminals?—To the question of terminals, in addition to whether they are common carriers or not.

15,464. And not to any other of their charges?—No.

15,465. (*Chairman.*) You do not mean to infer that any company claims to make a higher charge than its

maximum rate as laid down in its Act of Parliament, for haulage for instance?—No, I do not mean to say that.

15,466. (*Mr. Horsfall.*) You object to its being left so far as regards terminals, to the option of railway companies to charge whatever they consider reasonable?—I do.

15,467. You think that in case of difference arising there ought to be some appeal without the necessity of going to a court of law?—I think there ought to be a tribunal to which a trader may appeal; it is a very serious undertaking, particularly for a small trader; and although I am concerned for a large trader, still I do not consider that small traders should be at all swamped or crushed. I say that in the case of a small trader it is almost impossible for him to bring a great railway company to book in a court of law, and that there ought to be some tribunal or department to which he can appeal. I give as an illustration the action of the Poor Law Board as a check on the administration of the Poor Law. I have been an elected guardian of the poor for 10 years, and if it were not for the easy appeal which boards of guardians on the one hand, or the poor on the other hand, or even any parishioners have, to the Poor Law Board, there would be an immense amount of quarrelling and litigation. Of course, some of the functions of the Poor Law Board are judicial, they can make orders for the government of the proceedings of the boards of guardians, but I should think a very large portion of their duties is that of deciding points for parties who appeal to them; they do not give a judicial decision, but they have got the cases all before them; they know what has arisen upon the subject before, and they give advice, and armed with that advice or with that decision the parties are then prepared, if necessary, to appeal to the law. It is the same thing with regard to the Committee of Council on Education. If you were to take away, in the one instance, the President of the Poor Law Board, and in the other the Vice President of the Committee of Council, it seems to me that the affairs of those two departments of the country would be thrown into confusion.

15,468. (*Mr. Glyn.*) In the case you have given of the Poor Law, you say after that decision they can appeal to a court of law; this would appear to introduce a new tribunal, which only leads to further expense, and at last you have to resort to a court of law; what is the advantage in that to the public or to the traders?—In the case we are speaking of, I think it would be a very great advantage. I believe that the existence of a functionary or tribunal, to which any person aggrieved by the railway charges might appeal, would be a great check on the companies, it would prevent many disputes arising, and then the decision or report by way of opinion upon a case which a trader might get from that tribunal would strengthen him very much if he had to appeal to a court of law.

15,469. (*Mr. Hamilton.*) Then you do not propose to give the judgment of that tribunal the effect of a legal judgment as binding upon the parties?—I would give it the effect of a legal judgment, but I think it would only be fair to the railway companies that they should have an appeal from that to a higher court.

15,470. (*Mr. Horsfall.*) Which would always be exercised, would it not?—I should think not, because it would be a very strong presumption against them if the decision of the department were adverse.

15,471. (*Mr. Hamilton.*) Do you propose that every trader in the case of a grievance against a railway company should have a right to appeal to this tribunal without paying for it?—The question of paying I have not thought of.

15,472. If people are able to litigate claims without paying for it, would there not be a great number of them?—I should think no claims would be made which were not sustainable. It would be taking trouble for nothing, because the decision would be sure to go against the party who made the complaint.

15,473. (*Mr. Horsfall.*) Do you not think that an appeal to the Board of Trade might be based upon this footing, for instance, if a difference arose between a forwarder of goods and a railway company, as to what the terminal charge ought to be, which is now merely defined as "reasonable," that there might be an appeal made to the Board of Trade to appoint an arbitrator, who should say whether the charge was or was not reasonable, and if, on the one hand, the arbitrator decided that the charge was reasonable, then the party complaining should pay the expenses of that arbitration; and if, on the other hand, it was decided that it was not reasonable, then the railway company should, as is usual in cases of arbitration, pay the expenses of it?—I quite agree with that, with one exception, instead of the word "reasonable" I should substitute "legal," always supposing that the legal charges had been first defined.

15,474. I am going upon the law as it now stands. In railway companies' Acts it is generally defined that they should have the power of making a reasonable charge for terminals, that is, as the law stands now in most of the railway companies' Acts, assuming that to remain, do you not think that there should be a power of appeal to the Board of Trade upon the principle which I have just stated to you?—Assuming the law to remain in that vague state it would be desirable, but I think it would be merely perpetuating a very imperfect state of the law.

15,475. You would prefer a maximum terminal charge being defined?—Yes, charges under various circumstances, where the company find accommodation of certain kinds and where they do not.

15,476. (*Capt. Galton.*) Do you think such an appeal to arbitration as that would be less expensive than an appeal to a court of law?—I should think it would under those circumstances.

15,477. In most cases cannot an appeal be now made to a county court?—Yes, but the difficulty is very great in getting a satisfactory decision in a county court. In cases which have been carried into the county court, the judges themselves have stated that the law was uncertain, and not defined as to what railway companies might charge for terminal services, and that it resolved itself, after all, into a question of what was reasonable, and they in some cases, which I have read, qualified their decisions by saying, that they gave the best decision they could in the unsatisfactory condition of the law.

15,478. Then your argument resolves itself into this, that what you want is to enunciate more clearly what railway companies are entitled to charge?—Yes, and to appoint some authority to say what are the legal charges.

15,479. Do you mean some authority with technical knowledge?—Yes, some functionary of the State, some president of a railway board, or a person in that position, who would have all these Acts of Parliament before him.

15,480. Do you think there would be some safeguard for both parties in that way, because in having appeals to a court of law might not the functionary take strong views on the one side or on the other, and so give all his decisions one way?—For that reason I say it would be fairer to allow an appeal to one of the superior courts. We do not want an arbitrator to decide what is reasonable, we want to know what is legal.

15,481. (*Chairman.*) Does not the Act of Parliament in every case show what are the legal charges?—Certainly it does; but although they are printed in black and white, according to the practice of railway companies you cannot tell what they will charge. If you go to your solicitor he cannot tell you what are the legal charges which a railway company can make.

15,482. That is because he cannot pronounce whether in any given case the company is bound to act as common carriers or not?—And what charges they might make for what are called terminals, which means anything in practice.

15,483. (*Capt. Galton.*) Then you would have a fixed terminal charge laid down as a maximum?—Fixed terminal charges under different circumstances.

Mr. F. Wragge. 13 April 1866.

15,484. Do you mean different charges at different stations?—No; according to the services which they perform; in some cases they load or unload goods.

15,485. (*Mr. Hamilton.*) Of course you would make a difference between the terminal charges in London and the terminal charges in the country, taking into consideration the different cost of rendering those services?—If it included delivery of goods; that is the only point, I think.

15,486. (*Chairman.*) In fact, the duty of the court which you propose would be twofold; first of all to deal with the question of terminals, and secondly, to determine whether in any given case a company was bound to act as a common carrier or not?—Yes, and to decide for services which they actually render what they had a right to charge. Of course it may appear to be anomalous, but as traders our difficulty is not so much that we are overcharged as that we do not know what we are liable to be charged.

15,487. (*Mr. Glyn.*) What did you allude to when you used the expression of "services rendered?"—The loading and unloading of goods.

15,488. That comes within terminals?—Yes. I did not mean to speak of it as distinct from terminals; they charge what they call terminals where they do nothing at all.

15,489. (*Mr. Horsfall.*) But the maximum tolls and rates of charge are all defined in every Act of Parliament, are they not?—Yes, I believe they are all defined in all Acts of Parliament.

15,490. But that is not the case with regard to terminals?—That is not the case with regard to terminals.

15,491. And that is what you want to have defined?—Yes; I also argue very strongly in favour of an uniform maximum charge, as applicable to all railway companies alike. I think maximum charges for similar services should be applicable to all railway companies, because a trader who has to deliver goods at a place 50 or 100 miles off may have to pass over three or four railways. In our own case, situated as we are on a short line of railway in North Staffordshire, to get to a place which is distant 50 or 60 or 100 miles, we sometimes have to go over two or three and even four railways. If each of them make a different charge according to their special Acts of Parliament, it becomes a most complicated affair to ascertain what the total charge will be.

15,492. (*Mr. Glyn.*) But practically, do not the North Staffordshire settle the through rate?—Yes; they "quote the rate," as we say in railway parlance, they say what they will do it for.

15,493. Then, as you have nothing to do with the other companies, what difficulty is there?—The difficulty is in ascertaining what they have a right to charge us. They tell us what they will take the traffic for.

15,494. That is generally below their maximum, is it not?—Not in all cases; not in the majority of cases.

15,495. It is in all cases of long distance?—No.

15,496. On what articles is the charge higher than the maximum?—It is higher on iron in many cases.

15,497. For long distances?—Yes. When I say long distances, I mean distances of from 50 to 100 miles.

15,498. Do you mean that they charge more than the maximum, putting the terminal charge out of the question, or when you add the terminal charge to the haulage charge?—In practice what they do is this; they say that from one point to the other our rate is so much; they do not give any particulars, and you cannot make out by reference to their Act of Parliament how they make up that rate. If you say it is more than they are entitled to charge, or more than you can afford to pay, they say that is the lowest they will do it for.

15,499. (*Mr. Hamilton.*) I do not suppose that you are prepared to say that they actually break the law by charging more than they are legally entitled to do, but what you mean to say is, that they will not give the public any means of ascertaining whether they keep within the law?—I do not wish to make any grave charge unnecessarily, but I have a very strong opinion myself that they do break the law by making charges which they are not entitled to make; that is my own opinion.

15,500. (*Mr. Glyn.*) You mean that they exceed the maximum?—I mean that they do it under cover of the fact that it is so difficult to find out what the total of the charges which they are entitled to make amounts to.

15,501. (*Mr. Hamilton.*) You are not prepared to give the Commission any instance within your own experience to prove that charge?—No, I am not.

15,502. With reference to the point which you were speaking of just now, as to the interpretation of the words "reasonable charge" for terminals, what you propose is, that the meaning of that term "reasonable" should in all cases be determined upon the facts of the case?—Yes.

15,503. That each railway company should come before a tribunal to show what, under their peculiar circumstances, would be a reasonable charge for terminals, and that they should then be binding upon the public from thenceforward; does that statement meet your view?—I think not quite; what I mean is that the terminal charges which railway companies should be allowed to make, and which should be applicable to all cases, should be defined in a General Act of Parliament, and that the classes of services for which those terminals might be charged should be defined and terminals should be charged according to the nature of the service rendered. A table of three or four different classes of services would meet the case. For instance, one would be where the siding belonged to the company, another where the goods are delivered into the private siding of a trader, another where the company performs the service of loading or unloading, and another where companies collect or deliver goods. I am not speaking at this moment with exactness, there may be other classes of services which I have not referred to.

15,504. Then would you have it uniform throughout the country, without reference to the cost of rendering those services?—In the case of delivery and collection it may be according to the distance of the delivery.

15,505. (*Sir R. Hill.*) Probably you think it would be better to have these charges defined, even though they might not be strictly in accordance with the cost which the company might incur in respect of the terminal service?—I believe it would be better to have them defined, even although it might not be in strict accordance with the cost which the company might incur.

15,506. Some approximation to perfect fairness would be better than leaving it quite open, as it now is?—Yes; the advantage of uniformity and certainty would counterbalance many other disadvantages.

15,507. (*Chairman.*) Can you point out to the Commission the reasons why a trader who is aggrieved should not appeal to the law through its present tribunals?—Yes; one of the principal reasons is that in the case of a small trader the sum in question is often small, although to him it might be of consequence, and the risk and expense of going to law would be a greater evil to him than paying what the company think proper to demand. In the case of a large trader the difficulties which a company may throw in his way if he goes to law with them pending a decision by the court are immense, much greater than any one not connected with the management of a trade upon a large scale would imagine. If the owner of a large colliery or iron works which is served by one railway only was to bring an action against the company, they might practically place him in a state of seige, because he has no other way in or out of the works, by throwing difficulties in his way.

15,508. (*Mr. Glyn.*) Without asking for names, can you give any instance where that has been done?—Yes. I do know of an instance in which the proprietor

of a colliery and iron works took counsel's opinion as to whether a railway company could subject him to those annoyances.

15,509. What was the character of those annoyances?—The main one was, that for traffic for which they had always been accustomed to supply waggons, when he offended them they said it is not convenient for us to send you any waggons to day or the next day, and without refusing to supply the rolling stock, in practice they failed to do so.

15,510. (*Mr. Horsfall.*) Such a practice as that is not to the interest of railway companies, is it?—Of course it must injure their traffic, but the power that they possess of doing that deters traders from going to law with them.

15,511. (*Sir R. Hill.*) If they do so I presume they think it to their interest to do so?—I presume so.

15,512. (*Mr. Horsfall.*) Or else it probably arises from a little vindictive feeling on the part of the manager?—That may have something to do with it, but it is a poor remedy for the trader to be referred to, that there are the laws of the country, and that he can go to law with the railway company. If he actually comes to hostilities with them and gives them notice of an action at law, they have it in their power to cause him great loss and inconvenience. I can mention another case, if I am not called upon to give names, in which a trader disputed some charges, thereby offending the company; they threatened to make him pay down at the station for all his traffic as it went in and out, and to have a clerk there and pay over the money for every waggon of goods that went away.

15,513. (*Mr. Glyn.*) That is to say, they were inclined to refuse him credit for those charges?—Yes; but it was done more to give him a hint of the power which they had to cause him inconvenience.

15,514. (*Mr. Hamilton.*) Did he dispute the accounts?—He disputed some of the charges.

15,515. I suppose what the railway company did was to say that until that dispute was settled they would only carry his traffic for ready money?—Yes; that was of course what they said.

15,516. (*Mr. Horsfall.*) They have power under their Act of Parliament to refuse to take goods without receiving payment before the delivery of those goods?—I should think it is only under the common law if they have the power at all, not under any special Act of Parliament that I am aware of.

15,517. (*Mr. Hamilton.*) There is, I think, no Act to compel them to carry goods on credit?—No; I should say not. I apprehend that any carrier might demand the carriage before he moves goods.

15,518. (*Mr. Horsfall.*) You do not know any law to that effect?—I do not.

15,519. But there is a law giving a carrier a lien upon the goods before delivery for the carriage?—I believe the Carriers' Act does that.

15,520. (*Chairman.*) Will you give your third reason?—That is a reason which is common both to large and small traders, and which I have alluded to already, and that is the uncertainty of the result which would be obtained by an appeal to a court of law. The written law upon the subject is very uncertain and undefined, and I am told by lawyers that the precedents are very conflicting and uncertain.

15,521. Would not the want of precedents render it difficult to the new court to give satisfactory decisions?—No doubt at first it would, but then precedents would grow up.

15,522. In fact they would make their own precedents?—Yes.

15,523. (*Mr. L. Gower.*) If the law were clear should you still object to the present tribunal?—If the law were made clear that would certainly take away from the necessity for a new tribunal.

15,524. Is the county court tribunal at all competent to try these questions?—Yes, if it is put in the shape of an action for debt on one side or the other.

15,525. Could not every case be put in that shape if so brought within the limits of the county court?—I should think it might.

15,526. That is not an expensive mode of trying the question?—No; the county court is the most inexpensive court for recovery I suppose of debts that we have.

15,527. (*Mr. Horsfall.*) Do you think railway companies generally would be satisfied with the decision of a county court?—I should think not. I should think that in every case where they had a right of appeal they would most likely do so, because the county court judge is one of a large number, and each judge has no special knowledge of railway law, and his decision would be almost of course unsatisfactory to the party against whom it was given.

15,528. (*Mr. Glyn.*) If the amount of the maximum charge was defined, and not rendered, as it is, doubtful by the use of the word "reasonable" any longer, then I suppose you think a county court judge would have no difficulty in deciding the question?—He would then have very much less difficulty in deciding it, but I am not prepared to go the length of saying he would have no difficulty.

15,529. It would then be a very simple question, would it not, upon the interpretation of the Act of Parliament?—It would be a very much more simple question than it is now.

15,530. Do you think that the traders generally would agree to make the decision of a county court judge final if the railway companies would?—Provided the law was clearly defined, that is to say, provided the charges were clearly defined by law, I think they would.

15,531. (*Mr. Hamilton.*) In paragraph 2 of your preliminary statement you say that railway companies "consider how much they can probably 'get' out of the "trader, and defer to the occurrence of a future possible "but improbable dispute the items by which they make "up the amount of the charge." Is that a general allegation based upon some specific cases within your own knowledge?—That is a general allegation based upon my experience of dealings with railway companies. They quote you a rate without reference to the items of which it is composed, and entirely without reference to their Acts of Parliament, what they think, as the phrase is, the traffic will bear. I have said there "what they can get out of it." If you ask them for the items of which their total rate is composed, they consider the fact of being asked for particulars as an affront and an offence to begin with, and if you press them on the point, they will often, to make up the total, put in items which have no show of being legal. And in many cases they are obliged to make up the total by charging a general terminal of so much.

15,532. (*Mr. Glyn.*) Do I rightly understand you to say that in many cases the traffic managers, without referring to their Acts of Parliament to see what their maximum charge is, make a charge upon the traffic which is offered them as they see fit?—I do honestly believe that is so.

15,533. (*Chairman.*) Do I understand you to state that as the result of your own experience as a railway manager?—The Midland Railway Company at the time I was one of their managers had, I think, four goods managers, their line being divided for that purpose, and the rates we fixed for goods and minerals were fixed at meetings in conference with each other. I am quite sure we never troubled ourselves about Acts of Parliament or our legal powers at all. We simply considered how much we thought the traffic would bear, and what the public would pay for it without making a disturbance.

15,534. (*Mr. Hamilton.*) Do you know, of your own knowledge, any instance in which there has been a dispute as to the charge that the companies have been unable to state the items of that charge?—Yes, I do. I have had experience of cases in which that has been so; and the reason why I know that has been so is, that when they have been called upon to

Mr. F. Wragge.
13 April 1866.

give the items of which the total charge was composed, those items have evidently been merely squared afterwards for the purpose of making up the total, and the total has been made up by the addition of so much under the head of terminals.

15,535. Is it within your knowledge that, on the other hand, railway companies have often very great difficulty in getting traders who are allowed to send on their traffic on credit to settle their accounts?—Yes, they have. I am not complaining of the amount of the railway companies' charges so much as of their not being clearly defined by law.

The witness withdrew.

Mr. J. Lancaster.

Mr. JOHN LANCASTER examined.

15,536. (*Chairman.*) I believe you are a coal and iron master?—I am.

15,537. You are connected, I believe, with the Wigan Coal and Iron Company?—Yes.

15,538. Will you favour the Commission with your opinion with regard to the question of terminal charges by railway companies?—I am speaking now with reference to the coal and iron trade more particularly. I do not wish to go into the question of terminals connected with cotton or any other products, but I am confining myself to coal, iron, and raw materials. I consider there ought to be no terminal charges beyond the toll where the owners provide their own premises or wharves to have the waggons shunted into, and that the toll and locomotive charge is the only charge which a railway company is entitled to.

15,539. Is it your opinion that a railway company should be bound to take the carriages and locomotive into an owner's private yard without charging for that portion of the service?—Only to clear their own premises. They should render no service beyond placing the waggons off the railway on to the owner's siding at the nearest point at which they can do so.

15,540. What is your opinion with regard to the necessity of having uniform terminal charges fixed?—There was a good deal of discussion some years ago with reference to an attempt by the Great Western to charge a very high terminal rate, and there was a compromise made with the North-western Railway and the Lancashire and Yorkshire Railway, which arrangement has been carried out satisfactorily now for some years; and the coal and iron trade in our district are anxious that it should become universal. It appears to me to be satisfactory to those railway companies, and we think it is one which the public should be satisfied with also.

15,541. You wish that arrangement which at present applies to the North-western and the Lancashire and Yorkshire should be applied to all the railways in the kingdom?—Yes, and legalised. At present it is only by arrangement.

15,542. Then your answer comes to this, that you wish to have a maximum terminal charge fixed, just as much as a maximum haulage charge is fixed?—Precisely.

15,543. (*Mr. Hamilton.*) And that the maximum should be uniform?—Yes, for the same class of work performed.

15,544. (*Chairman.*) You do not go so far as to say that the terminal charges in London should be the same as the terminal charges in the country?—Yes, I will go the length of saying that all the charges should be alike.

15,545. (*Sir R. Hill.*) Those charges do not include cartage?—No.

15,546. (*Capt. Galton.*) What service or work do you consider the terminal charges to cover?—The railway company provide a wharf with a siding upon it, for which, as a rent, 2*d.* per ton is agreed to be paid. That is where the railway find the accommodation which you would call wharf accommodation; in addition, when they weigh with their weighing machine the carts that come for the coal, they charge 1*d.* a ton. That is the only service which the railway company is called upon to perform.

15,547. (*Chairman.*) Do they not make an extra charge for that service, or is that included in their terminal charge?—That is included in their terminal charge.

15,548. What you complain of is, that the charge they make for terminals is too great when you consider the service that they render?—It is so indefinite. We find when we go to the Great Western and other companies and ask them for a rate, and compare it with the Acts of Parliament, that there is a large margin for something, and they will not tell us what the meaning of that is. It is under the general head of terminals.

15,549. (*Capt. Galton.*) The rate which they give you includes the rate per mile as well as the terminals?—Yes, they are mixed together.

15,550. Therefore if you take off from that rate what they are entitled to charge as their maximum rate you find a large margin for what are called terminals?—Yes.

15,551. You wish that to be defined?—Yes, and not only defined, but that it should be kept as a separate account, and that the accounts ought not to be mixed up.

15,552. Do you not think that if the maximum terminal charges which railway companies might levy were defined in an Act of Parliament, that you would have to lay down a much higher sum than 2*d.* per ton which you say is now charged?—I think for the services rendered that would be ample payment.

15,553. (*Sir R. Hill.*) That payment has been settled by agreement, as I understand?—Yes, and carried out for some years.

15,554. Therefore we must assume that it is satisfactory to the company as well as to the trader?—Yes.

15,555. (*Mr. Hamilton.*) How are you to assume that which will answer for the North-western and the Lancashire and Yorkshire without much pains and laborious investigation would be an adequate remuneration to other railways?—I should say, in confirmation of my opinion, at the amalgamation of the London and North-western Railway these terms were deliberately settled.

15,556. When you came into this arrangement with those two companies, was it based on previous rates?—In some cases they charged 6*d.*, in other cases 4*d.*, and so on. It was quite an irregular charge. Our object was to fix it permanently.

15,557. Your principal object was to get it fixed and defined?—Quite so.

15,558. You did not wish to have services performed at an unreasonable rate?—No.

15,559. (*Sir R. Hill.*) You desire to have the convenience of knowing exactly what the company is entitled to charge?—Precisely. It is a very important thing when we are asked to make a quotation, that we should know exactly what the cost of conveyance is to a certain point, including every expense.

15,560. (*Chairman.*) That is, you want to be able to see at the moment what the highest possible charge of the railway company to you would be?—Precisely.

15,561. But you do not mean to say that they shall not be at liberty to charge a lower sum if they think fit?—They may charge as little as they like; but we want to know what the maximum charge is.

15,562. You do not ask for a uniform mileage rate?—No; that is a very important part of the question, which I wish to allude to hereafter. We only ask that the maximum rate shall be defined, leaving the companies every latitude beyond that.

15,563. What is your opinion with regard to their being only one terminal charge?—I am of opinion that when the goods go upon two lines they should not have the power of charging for terminal expenses. I can state a case in point. We have had to petition

against the Great Western; this year they have several Acts passing through the House of Commons, and we have already petitioned against them. They charge us 1*s.* 2*d.* per ton for carrying over about a mile of railway in our own trucks, and they make up the charge simply in this way; 6*d.* for tolls, and 6*d.* for locomotives. They have a power under that particular Act to charge a short mileage for the locomotive. That I presume is not general, but is a novelty, so far as that is concerned. Then they charge 2*d.* for terminals, when they do not provide any terminals making 1*s.* 2*d.* altogether.

15,564. (*Mr. Hamilton.*) Where is this?—At Wolverhampton.

15,565. You say that the Great Western render you services over a mile of their system?—Yes; they convey our coals from the North-western railway to certain gasworks at Wolverhampton, the railway being a mile long, for which they charge us 1*s.* 2*d.* per ton.

15,566. The coal being delivered to them by the North-western, and they delivering it at the gasworks?—Yes, merely delivering it into a private siding.

15,567. For that they charge you 1*s.* 2*d.* per ton?—Yes.

15,568. Does that include shifting from narrow gauge waggons into broad gauge waggons?—No, it is narrow gauge all the way.

15,569. (*Capt. Galton.*) They simply take the waggons from the North-western and shunt them into the siding of the gas company?—Precisely.

15,570. They have a wharf at the end, I presume?—There is no wharf at all. It is private property. It is exactly like the case I put where we provide wharves, and there is no terminal service.

15,571. (*Mr. Hamilton.*) Does it not involve keeping accounts between the two companies?—No; we have a separate account with them. They do not charge through the North-western.

15,572. You pay the North-western up to the point at which the carriages are taken on by the Great Western?—Yes.

15,573. And then you pay 1*s.* 2*d.* per ton for carrying the waggons to the gasworks?—Yes; they have been giving us their rates in conjunction with the North-western, and we see, by mixing the two, that they have taken 2*d.* off, leaving it 1*s.*

15,574. You do not contend that that is an illegal charge?—Yes, the 2*d.* is illegal, and we have been trying it for the last two or three years. We have been bringing an action against them.

15,575. What is the result?—It is not yet concluded They are in Parliament, and we are petitioning against them.

15,576. Besides contending that it is illegal in part, you contend that it is unreasonable?—Yes.

15,577. (*Capt. Galton.*) Has it taken you two or three years to get this action tried?—We have been since 1863 partly negotiating and partly litigating.

15,578. Is it not a very usual thing for a very short distance to charge a certain longer distance?—I think they are fairly entitled to the benefit of the six miles clause.

15,579. What should you consider a fair charge for the services which they render you?—Sixpence.

15,580. Altogether?—Yes, that ought to cover the whole of it.

15,581. (*Mr. L. Gower.*) Before what tribunal is this question now pending?—It is not actually before any of the courts yet.

15,582. (*Capt. Galton.*) Supposing coals are conveyed in their waggons, what is the maximum they can then charge you?—In other parts of the country it is the universal practice of these two great railway systems for the owners to find their own trucks for coals and minerals, so that they are the coal owners' own trucks.

15,583. (*Chairman.*) You say that you consider 6*d.* would be a fair amount for the Great Western to charge?—Yes.

15,584. Do I understand you to say that they should charge nothing for terminals, and nothing for locomotive power, but merely 6*d.* for the haulage?—In the 6*d.* is included the locomotive power. Three farthings per ton per mile is the usual rate now fixed for tolls, and $\frac{1}{4}d.$ per ton per mile for locomotive power.

15,585. Then you think that the charge that they make is beyond their legal maximum rate?—Yes, in this case it is. They charge 1*d.* per ton per mile, whereas now the almost universal rate is $\frac{3}{4}d.$ per ton per mile, and in many cases $\frac{1}{4}d.$ for the engine, making 1*d.* per ton per mile.

15,586. (*Mr. Hamilton.*) But the $\frac{3}{4}d.$ is for a long distance?—Beyond 25 miles.

15,587. Would it be reasonable to expect a railway company to carry for six miles at the same rate that it would carry for 25 miles?—Yes, I think it is reasonable. Three farthings per ton per mile is fixed in almost every Act which has been passed for some years.

15,588. But for distances under 10 miles?—For all short distances.

15,589. That has been fixed as the maximum coal rate?—Yes.

15,590. (*Chairman.*) Then you contend that the Great Western in this instance are actually charging more than they are legally entitled to do?—The Acts are very difficult of interpretation. One counsel's opinion is that they can charge 9*d.* per ton, and another counsel's opinion is that they can charge 1*s.* per ton. It is one of those points which it is really very difficult to define.

15,591. (*Mr. Hamilton.*) Is there anything in the Acts of the North-western limiting them to a charge of $\frac{3}{4}d.$ per ton per mile for short distances?—Yes.

15,592. As the maximum rate?—Yes, distinctly.

15,593. Over the whole system?—Yes; the Lancashire and Yorkshire, and I think the Midland the same. The rate of toll is $\frac{3}{4}d.$ per ton per mile up to 50 miles; and in some of their Acts they have power to charge for four miles, but generally the short toll clause is for six miles.

15,594. At what rate?—At $\frac{3}{4}d.$ per ton per mile.

15,595. There is no higher rate for a short distance upon the North-western system?—No, decidedly not.

15,596. (*Sir R. Hill.*) Then if the coals were actually conveyed six miles that would be the total charge?—Six times three farthings, and a farthing for locomotive power, locomotive power being charged according to distance.

15,597. The total charge for six miles would be 6*d.*?—Yes.

15,598. (*Chairman.*) With respect to having one terminal charge, do you go so far as to say that if a a company takes up your coals at one point and puts them down at another point upon their own system, and performs service in the way of shunting at both those points, that they are only entitled to charge for one of them?—We do not consider shunting as any extra duty.

15,599. But they claim it as such?—There is no instance of the companies with which I am in connexion having sustained such a charge as that.

15,600. (*Mr. L. Gower.*) If there is no charge allowed where waggons are run into the yards of private owners, would it not indispose companies to afford accommodation to traders having private yards?—I think, in the first place, they are bound to clear their own line and put the traders' waggons upon some convenient point, but that point we must always choose for the discharge of those waggons.

15,601. (*Mr. Hamilton.*) But they are not bound to choose the traders' yard for clearing their own line?—I take it that it is always their interest to do so. There is no dispute that if a trader provides a yard that is generally in a convenient place agreed upon between him and the railway company. I think there is no difficulty on that point.

15,602. But there is a distinct service rendered to the trader by taking the waggons into his yard or siding?—We hold not.

Mr. J. Lancaster.
13 April 1866.

15,603. You say it is a service to the company because it clears its own line?—Yes.

15,604. (*Sir R. Hill.*) In fact it is a convenience to the company and also to the trader?—If we asked the railway company to take our trains half a mile from their premises it would clearly be a service rendered for which we ought to pay; but if it is done merely to clear their own line, then we say it is not a service rendered to us.

15,605. (*Chairman.*) Then, in point of fact, with regard to the coal and mineral traffic carried on under ordinary conditions, you do not admit there should be any charge for terminals at all?—No.

15,606. Will you give the Commission your opinion with regard to short distance rates?—I think I have touched upon that subject incidentally in answer to the questions which have already been put upon this point. We are quite satisfied with the ordinary short rates in the General Acts which have been passed in the last few years, that is the six mile clause and the four mile clause, as it may be. In this case the Great Western Company have a short mileage upon the tolls, the tolls being fixed.

15,607. Have not other companies, like the North-western and the Lancashire and Yorkshire, such a power?—No. When the amalgamation took place the traders watched them closely, in order to get all these things pretty well defined. I may say they have worked since very satisfactorily to the public, and to the railway companies as well, I think.

15,608. (*Mr. Hamilton.*) How is it that the Great Western have this exceptional power?—I suppose they have not been watched so closely by the traders.

15,609. But they came before Parliament a little while ago, and I should have thought the traders had then an opportunity of watching them?—It has evidently been overlooked. I should say there is an attempt at uniformity in the Acts of Parliament relating to railways, but they are most difficult to understand.

15,610. (*Chairman.*) Is not that caused by modifications which have taken place from time to time in the Acts of the different companies when they have been in Parliament?—That is so, no doubt.

15,611. Supposing that a General Act were to be now passed, making all charges uniform, as time went on further modifications would probably be made when companies came to Parliament for fresh powers, and they might, in the course of a few years, be very much in the same position as they are now?—Yes; but I think that railways are now better understood than they were formerly. You have arrived at a point when you know that certain rates will pay, and therefore you ought to fix by one General Act a maximum toll, and then give the railway companies every latitude beyond that.

15,612. (*Sir R. Hill.*) If that were done it would be unnecessary to state the charges in the particular Acts?—It would be attended with expense, unless they complied with the general conditions.

15,613. They might be omitted altogether, might they not?—Yes, they might.

15,614. If they were embodied in a General Act applicable to all railways then existing, or which might thenceforward be made, it would be unnecessary to recite the tolls and charges in each particular Act?—Yes, I think it would.

15,615. (*Chairman.*) If you were to make a general uniform rate in the way which you propose, would you not be obliged to base your rate on what would pay in the most thinly populated agricultural district in the country?—The rates I have mentioned would pay anywhere, on any railway in the kingdom.

15,616. (*Sir R. Hill.*) Your wish applies to maximum rates?—Maximum rates only. There is one point I wish to mention with regard to waggons. It is a sore grievance with traders who have to send waggons. We are not allowed to go over the railway premises, or send an inspector to examine or report from time to time on the state of our waggons as they are travelling along; we have no control over them; we want them to be placed under some organized system similar to the clearing house system.

15,617. (*Capt. Galton.*) Do railway companies detain your waggons unnecessarily long on the railway?—Very much so, indeed.

15,618. So that you cannot work the stock in an economical manner?—We suffer grievous loss in consequence of the detention.

15,619. Because of being obliged to keep so many more waggons than you otherwise would do?—We have had waggons lost for three months at a time, and it is only by sending messengers over the country that we can discover where those waggons have been detained. We say that is not a state of things which ought to exist.

15,620. (*Mr. Hamilton.*) You want, in fact, to make them liable to pay demurrage to you for the detention of your waggons?—I would give them a reasonable time to convey waggons from point to point; but after that time has expired I think they ought to be under a demurrage.

15,621. (*Capt. Galton.*) Your waggon goes to some private trader?—I will assume it goes to a private trader or to our own wharves.

15,622. If it goes to a private trader, the private trader might keep it?—I would first invoice the waggon, say from Wigan to London, 24 hours is ample time to deliver that; then it is re-consigned, after being emptied, from London to Wigan, and 24 hours is enough there again. I would adopt the same principle at every town and every station, having nothing to do with how the trader might detain it; it is merely a question of the time that the railway company have that waggon in their actual possession.

15,623. (*Mr. Hamilton.*) How is the railway company to control the time that a waggon is kept by the consignee?—I do not propose that they should deal with that part of the question; it is only as to the time the waggon leaves its first destination, and the time that it gets to the trader.

15,624. That is the journey out?—Yes. Then they shall not be subject to any detention by the trader, the trader re-consigns that waggon back again; if there is more than 24 hours' detention then our charge would be for that as well.

15,625. Then, admitting that there is a detention sometimes arising from the fault of the railway company, is it not to be accounted for from the great irregularity and inequality of the traffic, the traffic sometimes being very great and sometimes being very small?—No, I think it occurs more in this way, that there is traffic which they give the preference to when they have a rush of business; it is very natural that they should give a preference to that traffic, the delivery of which is probably more urgent and pays them better.

15,626. But if your system was adopted, and the railway company was to claim any demurrage for the detention of waggons, they might refuse to take your goods on consignment until they have already forwarded them outwards?—There is a clause in the Acts of Parliament that after a certain notice they are bound to take our cargoes.

15,627. Would they be liable to account to you if they did not do so?—They would be liable to an action for damages if they did not do so.

15,628. Even supposing that all their railway stock happens to be employed at the moment?—We find the stock.

15,629. They find locomotive power?—Yes.

15,630. Suppose that all their locomotive power happens to be at the time actually engaged?—They are bound under the existing Acts to forward, if we tender them 40 tons of coal, they are bound to take them on. I think the railway companies do not complain of that.

15,631. (*Chairman.*) You do not go so far as to ask that private owners should be admitted to the clearing house?—No, because I believe that is a private establishment not belonging to the railway com-

panies; they may join in it, but to all intents I believe it is a private establishment.

15,632. (*Capt. Galton.*) It has got an Act of Parliament?—I was not aware of that; then of course it is to that extent public.

15,633. You will not go the length of insisting that railway companies should provide all the stock?—No, I think that would not be to the interest of the trade I represent. I have studied that question, and I have consulted a great many parties upon it. The North-eastern do find the rolling stock. I am interested in some colliery operations there, and although the North-eastern have an enormous rolling stock, consisting of all classes of carriages, they are better enabled to do it perhaps better than any other company, but if the North-western, and the Lancashire and Yorkshire, or any of the other companies adopted that system, we should be left, so to speak, in the lurch.

15,634. It would require, would it not, a very much less quantity of stock altogether if the railway companies found the whole?—I think not.

15,635. You do not think that empty waggons, which have now to go to your colliery for instance, could be utilized if they were public property?—To some extent that is so. On the other hand our own agents and the people who have charge of them are more vigorous, perhaps, than they would be with railway companies' waggons. I think one thing compensates for the other.

15,636. At any rate it would involve less sorting of waggons?—Yes.

15,637. And less expense of locomotives and shunting?—Not much of that; you must have a separate class of waggons for minerals and coals generally.

15,638. As the waggons belong to different colliery proprietors, they must sort all those waggons out if they have got a train to make up; for instance, suppose waggons belong to six different collieries, they would have to sort them all out separately, so as to deliver them back to their own collieries?—Yes, each colliery would ask for half a dozen trucks.

15,639. But if they were railway property there would be no special trucks belonging to particular individuals?—No.

15,640. (*Mr. Hamilton.*) Are you satisfied if you get an equivalent number of trucks belonging to somebody else?—No. There are 3,000 trucks belonging to the concern I am connected with. The whole of the traders in this district find their own trucks.

15,641. Do you expect to have your own particular trucks sent back again?—Yes, we must have our own trucks, because we have to keep them in repair.

15,642. (*Capt. Galton.*) If your trucks went to somebody else they would not be so well repaired as they are by you?—No.

15,643. (*Chairman.*) Some of your neighbours would keep a short supply of trucks on the chance of getting some of yours?—I think it would create a great deal of jealousy. In the North-eastern district, where the railway companies find trucks, it is very often thought that one party is favoured over another, but if they have their own rolling stock, it is their own look out. I think we are very moderate in our wish in this matter, because we only want 1*s.* 6*d.* per day for every day a waggon is detained. The clearing-house system have charges varying from 1*s.* 6*d.* up to 3*s.* 6*d.* per day.

15,644. (*Capt. Galton.*) But you want a system of demurrage adopted?—Yes, we think that after 24 hours' delivery to a company if the coals are not delivered by the consignee, there ought to be a demurrage paid for the waggons.

15,645. You would make that demurrage irrespective of the distance which the coal had to travel?—Yes.

15,646. Which company would have to pay for it? For instance, supposing you were sending coal from Wigan to Plymouth, it would pass over the North-western, the Midland, and the Bristol and Exeter?—I would hold each company liable, not the three companies conjointly. I would give each company a day to perform the service, and they should report where the detention occurred. That should be compulsory. I would not make the North-western pay for demurrage on other lines when we are sending coals to Southampton. I would only make them responsible for their own, except the reporting.

15,647. You would make them responsible for reporting when the waggons leave their own line?—Yes.

15,648. You think each company should report when the waggons came on and when they left their own line?—Yes.

15,649. (*Chairman.*) Supposing you sent coal over the North-western system to be forwarded to Southampton and any delay or loss should arise, would not the North-western, supposing they were the first company upon whose line those coals went, be liable at law to the person who sent them?—I am afraid there is no remedy.

15,650. But that is the case, is it not?—Yes, that is where they are common carriers; but they are not common carriers in this case; they are the owners of a railway, and only carriers to a limited extent. I think that would apply to the case of common carriers only. The demurrage question is a question which we feel strongly upon. We have instances of a cargo of coals being detained for 14 days at once in going 24 miles, but we have no remedy.

15,651. (*Mr. Hamilton.*) What was the explanation given to you of the delay in that case?—They will not give any other explanation than general ones, such as that they cannot attend to it, and that they have too much traffic. They will not give any definite explanation.

15,652. Was it asked for in that particular case?—Yes, certainly; I tried to bring it before a Parliamentary Committee.

15,653. The instance you give is, that the trucks of a colliery were detained 14 days going 24 miles, and that you practically had no redress?—We had no redress whatever. We have sent coals from a colliery for a vessel waiting in the dock, and in 14 days they have not been delivered; and I say we have no remedy.

15,654. (*Capt. Galton.*) Could you not have recovered damages against the railway company?—Our legal advisers say not.

15,655. (*Mr. Hamilton.*) I presume that was a very exceptional case?—Upon looking over that same company's performances, I find that in loading vessels we can never get them laden under seven days.

15,656. The distance being 24 miles?—Yes, seven days was the minimum.

15,657. Have you ascertained that that was not the fault of the vessel, but was the fault of the railway?—The vessel was waiting, and charged us demurrage for the detention.

15,658. (*Capt. Galton.*) Was that at Liverpool?—Yes.

15,659. (*Mr. Hamilton.*) Do you think that if railway companies were compelled to pay demurrage detentions of that kind will not occur?—Certainly not. We should then have a remedy; we should charge them 1*s.* 6*d.* a day for each of the waggons, and unless Parliament gives us some control of that kind, I consider that we are entirely in the hands of railway companies.

15,660. (*Sir R. Hill.*) Do you happen to know what was the real cause of that detention of 14 days?—A crowding of the cotton trade. The cotton trade is a little irregular, and is a more valuable trade to the railway company than coals, and they consequently give a preference to that.

15,661. (*Mr. Hamilton.*) It was, in fact, then that the line was blocked up by other traffic?—Yes, and there was probably some defect of management at that particular point.

15,662. (*Sir R. Hill.*) Is not 1*s.* 6*d.* per waggon per

Mr. J. Lancaster.
13 April 1866.

day a high charge ?—It is the lowest rate that we have ever been charged by the clearing house system ; it is what the North Staffordshire charge people detaining their waggons, and I have taken that as the standard.

15,663. (*Chairman.*) The North Staffordshire company find waggons I presume ?—In some cases I believe they find waggons.

15,664. (*Mr. Hamilton.*) That is about 20*l.* a year ?—A good waggon is worth 14*l.* a year, but it is not the actual cost of the truck ; it is the inconvenience to our trade of not having trucks there.

15,665. (*Capt. Galton.*) They ought to pay more than the mere interest on the value of the waggons ?—Decidedly ; besides the inconvenience there is the loss of our trade, and I think we have been very moderate in fixing it at 1*s.* 6*d.* We have taken the very minimum.

15,666. (*Mr. Hamilton.*) I think you stated that railway companies were bound by law to forward goods ; take the case of coals ; they are bound to forward 20 tons of coal within 24 hours, are they not ?—They are to take it from our siding. We know nothing of it afterwards.

15,667. Is there any obligation upon them about delivery ?—I think not.

15,668. (*Chairman.*) They are not bound in any manner to deliver the coals within a reasonable time ?—They are to take them away within a specified time. I am afraid we have no remedy.

15,669. Does it ever happen that when your waggons have been detained for a very long time on account of some cause over which the railway companies have no control, such as an accident, they have ever given you a drawback ?—No. If it was purely through an accident I am sure no one would be so unreasonable as to ask for a drawback. It is merely in cases where a preference is being given that we feel a soreness. We do not think it fair that a railway company should give an undue preference to one class of traffic over the other. We say, let us have our fair share of the use of the line, and that is all we ask. I desire it to be distinctly understood that we do not wish to press railways for uniform rates all over the country. We have discussed that very fully. We do not wish the feeling to prevail that we want to compel railway companies to carry at one uniform rate. We only ask that the maximum tolls shall be at one fixed rate, giving them every latitude for special rates where they have great competition and where there are local circumstances demanding that.

15,670. (*Sir R. Hill.*) When you say maximum toll, what do you mean by "toll"?—A toll is for the use of the line, that is the general term. The toll is for the use of the way, the railway finding the waggons or rolling stock.

15,671. When you pay a toll the trader not only finds waggons but locomotive engines ?—That is a defined and separate charge, of which we have nothing to complain.

15,672. What you want is that a maximum shall be laid down for the total charge per mile ?—Yes.

15,673. (*Chairman.*) In fact you want to be able to know that if you wish to send coals from one part of England to another part of England you cannot be charged more than a certain sum ?—Exactly. They may charge whatever they like less. We have no objection to any smaller rates.

The witness withdrew.

Adjourned till Tuesday next at 12 o'clock.

Tuesday, 17th April 1866.

PRESENT :

The Right Hon. Lord Stanley, M.P., F.R.S.	Geo. Carr Glyn, Esq. M.P.
The Hon. E. F. Leveson Gower, M.P.	Capt. Douglas Galton, R.E., C.B., F.R.S.
Sir Rowland Hill, K.C.B., F.R.S.	William Pole, F.R.S., *Secretary.*
T. B. Horsfall, Esq., M.P.	

The Right Hon. THE EARL OF BELMORE in the Chair.

Mr. John Cosgrove examined.

Mr. J. Cosgrove.
17 April 1866.

15,674. (*Chairman.*) I understand you are the manager to Messrs. Bass and Co. brewers, of Burton-on-Trent ?—I am.

15,675. Do you appear here to represent other firms at Burton ?—I appear here to represent the trade generally.

15,676. I understand that you have some complaints to make against some of the railway companies with whom the brewers of Burton-on-Trent do business, to the effect that they give preferential rates to some of their customers ?—I have.

15,677. Will you be kind enough to state which companies you refer to, and all the particulars of those complaints ?—I refer to the three companies radiating from Burton, but more especially to the Midland Railway Company.

15,678. Can you state the names of those companies ?—The Midland, the North Staffordshire, and the London and North-western are the three companies which radiate from Burton. The former has had possession of the traffic for many years, and at the present time retains the greater share of it.

15,679. Have you a memorial from Burton-on-Trent to this Commission upon the subject ?—I have.

15,680. Will you be kind enough to hand it in ?—Yes.

The witness delivered in the same, which is as follows :

To the Royal Commissioners on Railways.

My Lords and Gentlemen,— Burton-on-Trent, 12th April 1866.

We, the undersigned brewers of Burton-on-Trent, beg permission to lay before you the appended detailed statements concerning the management of the railways radiating from Burton, viz. :—the Midland, the North Staffordshire, and the London and North-western, more especially of the first-named company, which until the recent introduction of the London and North-western line possessed nearly the whole of the traffic, and even at the present time retains by far the greatest share of the same.

We propose to exhibit the grievances and abuses of which we have to complain, under three heads, viz.:—1st. Favouring Rates; 2nd. Terminal Charges and their Abuses; 3rd. Unequal Rates.

1st.—Favouring Rates.

London and North-western Stations via Midland and North Staffordshire Railways.	Carted Rates paid by Trade prior to 1st June 1865.	Less 1*s.* 6*d.* for Cartage.	London and North-western Private Scale for Messrs. Allsopp & Sons, now Public Station to Station Rates.	Per Centage of former Rates over present Ones.

	32,733	8	10			
Or say	-		-	30,000	0	0
				77,378	18	7

The above amounts have been claimed from the companies under the following circumstances:—

It having come to our knowledge that our neighbours, Messrs. Allsopp and Sons, were having their goods carried under an agreement, dated November 1859, with the London and North-western Railway Company, at the lower scale of rates to and from all that company's stations, and were also being allowed, from the period of laying down their private lines upon their own premises, 9*d.* per ton on all goods loaded into or unloaded from railway waggons by them; and in addition 4½*d.* per ton for haulage of the same by engine power to and from the railway stations; we have claimed from the Midland Company, (in virtue of agreements with some of our body, viz.: Messrs. Bass and Co., 1st January 1861; the Burton Brewery Company, 1st January 1861; Messrs. Hill and Sons, April 1st 1862; Mr. Evershed, August 1860; and Mr. Nunneley, August 1860; in which "they engage to place us on as favourable "terms in every respect as any other party trading in or "with Burton,") like reductions upon the rates charged to and from London and North-western stations, from November 1859 to June 1st, 1865, (when through the movement of Messrs. Bass and Co. in the matter the lower scale was openly brought into operation,) and from the opening upon our respective premises of our private lines communicating with the Midland Railway, viz.: Messrs. Bass and Co., October 20th, 1862; Messrs. Ind, Coope, and Co., March 6th, 1865; Messrs. Worthington and Co., October 1863; Messrs. Salt and Co., November 30th, 1861; and The Burton Brewery Company, February, 1863; the same allowances for loading and unloading the whole of our goods to or from any railway, such terminal services having previously been performed by the company themselves at their stations here. During the period claimed for, not only did we not receive a farthing, but were perfectly unaware that we had a right to payment for such performance; that our neighbours were having an allowance of any kind, or that the Midland Company were parties to making such allowances elsewhere. The rules, however, of the Midland Association (formed by the Midland, London and North-western, North-eastern, and other companies,) show that such allowances have for many years past been made by the railway companies to parties having sidings from their lines, *e.g.*, Messrs. Watts and Co., Soho, 7*d.* per ton; Messrs. Murcott and Wright, 1*s.* per ton; and W. Williams, Albion, 6*d.* per ton.

We have it on high authority that the Midland Company knew all along the scale of rates according to which Messrs. Allsopp and Sons were paying the London and North-western Railway Company. For nearly the first three years of the period the Midland Company performed the work of sending and invoicing Messrs. Allsopp and Sons' goods hence to London and North-western stations, (that company having then no station at Burton,) at precisely the same rates as ours; the London and North-western Company reducing them by subsequent monthly overcharge sheets to the private scale, and sending such sheets to their various stations, and to the Midland Company to check the correctness of the weights. (See examples of such sheets.) When afterwards the London and North-western Company established their line in the town the same system of private reductions from the public rate was carried on in favour of Messrs. Allsopp and Sons. We must not omit to remark that the North Staffordshire Company were also privy to this arrangement, regularly receiving the private reduction sheets upon that portion of the traffic which the Midland Company here had handed to them for passage over their line to Crewe, for the London and North-western stations lying northward of there.

In submitting the serious cases of injustice to which we have been subjected, we beg to express a well-founded hope that parliamentary intervention is at hand to render it impossible in the future that any railway company shall be able so far to exceed its proper functions, as to attempt by preferential rates to place the goods of any one trader at a cheaper cost, in the various ports and markets of the country, to the corresponding disadvantage of others en-

Mr. J. Cosgrove.

17 April 1866.

gaged in the same town, and in the same department of enterprise.

We conceive that railways are legalized in the interest of the public as well as in that of the companies, that the Legislature could never have contemplated on the par of the few groups of individuals (who now have the monopoly of the carrying business,) such an unfair and dangerous interference with the freedom of trade, interference implying the assertion of a principle, which, if carried out, would place it in the power of the railway body to dictate the terms and conditions of the whole trade of the country.

2ND.—TERMINAL CHARGES AND THEIR ABUSES.

	£	s.	d.
By Messrs. Bass and Co. from Midland Railway up 30th June 1865, from 1st July 1862	8,704	18	9
Do. estimated similar claim for 4 years preceding - - - - - -	8,000	0	0
	16,704	18	9
Estimated claim of the whole trade at least -	14,000	0	0

Or say 30,000*l.* in all.

The above amounts represent a moderate estimate of the claims due to us as a drawback at 2*s.* 6*d.* per ton, difference between 4*s.* and 1*s.* 6*d.*, the station to station terminals. Messrs. Bass and Co., who have already sent to the Midland Company an account for part of the term, seven years, for which we intend claiming, have given that company notice they will pay no more carted rates, but demand station to station rates. We are about to follow a like course.

Rule 69 of the Railway Clearing House (to whose rules all the associated railways subscribe) states, "that an "allowance at the rate of 8*s.* 6*d.* per ton in London and 4*s.* "per ton in the country is made for the terminal expenses "on goods traffic when carted, and 1*s.* 6*d.* per ton, both in "London and the country, when not carted." For conveyance of our ales hence to stations on railways, beyond our local lines, we are paying, and have hitherto paid, what are termed carted rates. No carting has ever been done here by the company. Those of us who have no private lines in connexion with the railway cart the ale to the station ourselves. Under these circumstances we are surprised to learn that the Midland Company has for a number of years been receiving, in addition to their mileage proportion of the through rates paid by us and divided by the clearing house, the sum of 4*s.* per ton for their Burton terminal charges, precisely the same as the companies owning the destination stations where carting actually *is* performed. A glance at the tabulated statement under the head of Unequal Rates will show, on the other hand, that upon the division of the very few station to station rates we have, viz., at Glasgow, and on the London, Brighton and South Coast Railway, the company are content to receive the proper allowance of 1*s.* 6*d.* per ton for Burton terminals. The work performed by the companies at this end is precisely the same whether they obtain 4*s.* or 1*s.* 6*d.* We have heard of traders in other places claiming a drawback of 1*s.* 6*d.* per ton, indeed we have done so ourselves in the instances of hops arriving at delivery rates when the carting is saved to the company, but in the case of our ale the mischief is, that through the terminals being concealed in the gross charges, we were unaware that they included a carted terminal at Burton.

In calling your attention to the vague and unsatisfactory manner in which terminals are now levied, we earnestly beg that you will recommend that the railway companies shall for the future be compelled by legislative enactment to state in a fair and open manner, separately from the mileage rates, what are their terminal charges on the various classes of goods, and the particular service or services they include. May we also beg that you will cause the Secretary of the Railway Clearing House to be invited to give evidence on this branch of a subject so important to the trading interests of the country generally.

The summary and foregoing detailed statements show,—Firstly. The great inequalities existing in the rates between Burton and the various stations upon any one given railway, and the curious and anomalous fact of the home railway company, the Midland, being in receipt in so many instances of a variety of rates to one place, viz.: the various points of junction with the other lines; as instances, upon our goods proceeding to North-eastern stations they would obtain between Burton and their Normanton Junction rates of 1*d.*, 1·1*d.*, 1·2*d.*, 1·3*d.*, and 1·4*d.* per mile, the last being 36½ per cent. higher than the first. Upon Lancashire and Yorkshire traffic they receive ten different prices

Mr. J. Cosgrove.

17 April 1866.

per mile between Burton and their Oakenshaw Junction; upon the Manchester, Sheffield, and Lincolnshire Railway a similar variation to their Eckington and Lincoln Junctions, while upon traffic to Great Northern stations they are obtaining, between Burton and their Nottingham and Hitchin junctions, the astounding variation of rates from 1·4*d.* to 2·9*d.* per mile, or 109¼ per cent. difference, and so on with regard to freights handed over to the other companies. Such diversity of charges to one place can surely admit of no explanation in the ordinary principles of commercial dealings. As a triumph, however, of the present system of railway administration we call special attention to them.

Secondly, Inequality of charges as between one railway and another. Why should the rates from Burton to the group of lines, London and South-western, North British, Furness, and London, Chatham, and Dover, be 15½ per cent. higher than the Scotch group; the London, Brighton, and South Coast, Maryport and Carlisle, South-eastern, and Whitehaven and Furness, 29¾ per cent. higher; the North Devon, Great Western, and North-eastern, 46¼ per cent. higher; the Lancashire and Yorkshire, and Manchester, Sheffield and Lincolnshire, 63 per cent. higher; and, finally, the Cambrian and Great Northern, 121¼ per cent. higher?

Local Rates.

London and North-western.—For all distances under 50 miles, 2*d.* per ton per mile; for all distances over 50 miles and under 75 miles, 1¾*d.* per ton per mile; for all distances over 75 miles (except London and Dublin), 1½*d.* per ton per mile; minimum rate 3*s.* 4*d.* per ton, no greater charge than 15*s.* for the first 167 miles; for distances over 167 miles at the same proportion. "Empty casks" to be charged at the same rate per ton as when full.

North Staffordshire.—The same as the London and North-western, according to distance. Empty casks to be charged at the same rate per ton as when full.

Midland Railway.—1½*d.* per ton per mile; minimum rate 5*s.* per ton. Empty casks to be charged at the same rate per ton as when full.

The above rates include station to station terminals.

Rates between Peterboro' and Great Eastern stations for Burton ale, two ton lots, 1½*d.* per ton per mile: minimum rate, 5*s.* per ton; maximum rate, 11*s.* 8*d.* per ton. Empty casks carried free throughout the system.

Proposed Rates upon Local and Foreign Lines.

Ale rate, Burton to London, to be 10*s.* per ton, including terminals as at present. Empties to be returned free, as upon the Great Eastern, Lancashire and Yorkshire, all railways out of Liverpool and Manchester to certain districts of Lancashire and Yorkshire, and from certain stations upon the South-eastern Railway to London.

That the minimum rate be 3*s.* 4*d.* per ton, with a progressive rate of 1½*d.* per ton per mile, not to exceed 11*s.* 8*d.* as upon the Great Eastern Railway. Empty casks to be carried at one-half the above rates from all places, except Liverpool, which should be free as in the case of London. These rates to include station to station terminals.

For distances above 140 miles, 1*d.* per ton per mile; for distances above 200 miles, ¾*d.* per ton per mile, or 0·8*d.*, as at present charged to Scotch lines. These last rates to have the station to station terminal charges of 3*s.* added. Empty casks to be carried at one-half the above rates.

This comparative statement exhibits the fact that the trade of Burton is placed at a decided disadvantage, in the cost of conveyance of its productions to the important port and market of London. While the rates charged to the brewers on other parts of the Midland system sending to London average but 1*d.* per ton per mile, by the London and North-western 0·9*d.*, by the Great Eastern 0·9*d.*, and porter from London only 0·8*d.* per mile, we are made to pay 1·4*d.* Again, if we refer to the traffic which the Midland and London and North-western carry for us to stations upon the London and South-western, and London, Chatham, and Dover lines (see Section A.), we find they are content to receive upon a not inconsiderable portion 0·8*d.* and 1*d.* per mile as their charge as far as London, may it not be fairly asked how they can justify a higher rate per mile for conveyance to the London market? It is true in the latter case a terminal of 1*s.* 6*d.* is incurred, but 1*d.* per mile, or 10*s.* per ton, the proposed rate, would cover this, and the average of the two mileage charges we are comparing, with, apart from the consideration of the immensely larger trade we do in London, which, under the stimulus of a fairer tariff, we should without doubt greatly increase.

Our casks are handled with less difficulty than grain or heavy manufactured articles, they are easily moved by rolling, they are good loading; every waggon which left Messrs Bass & Co's yards in season ending 30th June 1865 carried an average weight of 2 tons 17 cwt., while the London waggons during the same period carried 3 tons 13 cwt., (the figures having been several times tested are accurate,) they are of little or no risk to the railway companies, inasmuch as the claims for damage paid to the same firm by the companies during the whole of last year amounted to but 28*l.* 10*s.* 11*d.*, on a traffic paying over 100,000*l.* for carriage. No sheeting to protect them from the sun has hitherto been afforded, nor do the companies provide us with warehouse room free or at a nominal rent as in the case of grain at Leeds, Wakefield, Manchester, London, &c. Large rents are on the contrary paid by the brewers to the companies annually for the use of ale stores.

3RD.—UNEQUAL RATES (Section C.)

Little Bytham	„	10 0	7 0	63	1·3	11 1	38½			
Nantes (France) to Gloucester		11 to 12	Per Vessel		Average through rate 18*s.* 7*d.* per ton.					
Gloucester to Burton, as above		7 1	- -							
Hamburgh (Germany) to Grimsby		6 to 7	Per Vessel		Average through rate Grimsby, 17*s.* 6*d.* per ton. West Hartlepool, 18*s.* 2*d.* per ton.					
„ „ W. Hartlepool										
Grimsby to Burton, as above		11 0	- -							
W. Hartlepool, do		11 8	- -							

It will be seen the rate from Grimsby is nearly double that from Newport; Great Northern district rates 40 per cent. higher still; and that barley can be carried from France and Hamburgh as cheaply as from the Great Eastern Railway.

The traffic of the brewers with the railway companies at Burton is estimated to yield to the latter about 300,000*l.* per annum, a sum so considerable, we submit, as to entitle the trade from which it springs to the highest consideration and support from the companies interested.

In conclusion we beg to express a hope, if after due consideration of the working of the present system of management it is found impracticable to carry out the provisions of the Act of 1844 in reference to railways, that the Legislature will secure, in the interests of trade and commerce and the public generally, the establishment of some wise and reasonable system of supervision of the administration of railways; that a permanent board of commissioners shall be appointed to revise all rates from time to time; and that it shall form a summary jurisdiction to which busy men can appeal for correction and redress of all well founded abuses and grievances.

Finally, we hereby depute Mr. John Cosgrove, manager of the railway business of Messrs. Bass, Ratcliff, and Gretton, to tender this our evidence, and to give expression to our views generally.

We have the honour to be,
My Lords and Gentlemen,
Your obedient Servants,

BASS, RATCLIFF, & GRETTON.
WORTHINGTON & CO.
THOMAS SALT & CO.

CLEMENTS & BERRY.
SYDNEY EVERSHED.
JOHN BELL.

Mr. J. Cosgrove.

7 April 1866.

15,681. Will you give the particulars of your complaints?—We propose to exhibit the grievances and abuses of which we have to complain under three heads, namely, 1st favouring rates, 2nd terminal charges and their abuses, 3rd unequal rates. We then give the list of rates, and proceed to say: "It "having come to our knowledge that our neighbours "Messrs. Allsopp and Sons, are having their goods "carried under an agreement dated Nov. 1859 with "the London and North-western Railway Company at "the lower scale of rates to and from all that Com-"pany's stations, and were also being allowed from the "period of laying down private lines upon their own "premises 9*d.*, per ton on all goods loaded into or "unloaded from railway waggons by them, and in ad-"dition 4½*d.* per ton for haulage of the same by engine "power to and from the railway stations, we have "claimed from the Midland Company (in virtue of "agreements with some of our body, namely Messrs "Bass and Co. 1st Jan. 1861; the Burton Brewery "Company, 1st January 1861, Messrs. Hill and Sons, "1st April 1862; Mr. Evershed, August 1860; and "Mr. Nunnely, August 1860, in which they engage "to place us on as favourable terms in every respect as "any other party trading in or with Burton,) like re-"ductions upon the rates charged to and from Lon-"don and North-western stations from Nov. 1859 "to June 1st, 1865, (when, through the movement of "Messrs. Bass and Co. in the matter, the lower scale "was openly brought into operation,) and from the "opening upon our respective premises of our private "lines communicating with the Midland railway, "namely, Messrs. Bass and Co. October 20th, 1862, "Messrs. Ind, Coope, and Co., March 6th, 1865, "Messrs. Worthington and Co., October 1863, "Messrs. Salt and Co. November 30th, 1861, and the "Burton Brewery Company, February 1863, the "same allowances for loading and unloading the "whole of our goods to or from any railway, such "terminal services having previously been performed "by the Company themselves at their station here. "During the period claimed for not only did we not "receive a farthing but we were unaware that we had "a right to payment for such performances; that "our neighbours were having an allowance of any "kind; or that the Midland Company were parties "to making such allowances elsewhere. The rules "however of the Midland association, formed by the "Midland, London and North-western, and North-"eastern and other companies, show that such allow-"ances have for many years past been made by the "railway companies to parties having sidings from "their lines, *e.g.* Messrs. Watts and Co. Soho, 7*d.* "per ton, Messrs. Murcot and Wright, 1*s.* per ton, "and W. Williams, Albion, 6*d.* per ton."

15,682. (*Capt. Galton.*) You had an agreement with respect to traffic with the Midland?—We had an agreement with the Midland that they should put us on as good terms as any other customer. The private rates ranged from 11 to 105 per cent. lower than the public rates. They were invoiced at the public rates, and then in the monthly overcharge sheets they were reduced to these lower amounts.

15,683. Do you mean to say that you made an agreement with the Midland Company in 1861 to place you under as favourable terms as any other party?—Yes.

15,684. At that time and after that time they still continued to charge you those rates in excess of what were being charged at the same time to Messrs. Allsopp?—They did, up to June 1865.

15,685. (*Mr. Glyn.*) Were they charging the lower rates to Messrs. Allsopp?—There was only one railway station there up to 3 years ago, namely, the Midland, and therefore they did all the work.

15,686. Do I understand you to say that the invoices were made out by the Midland for Messrs. Allsopp?—Yes, for the first three years for the North-western stations, and charged at the same full rate as ours would be.

15,687. The North-western line proper terminated at what point?—The Midland would put the traffic on at various junctions. They would take it as far as they could to get the highest mileage.

15,688. How far did Messrs. Allsopp's cargoes really go upon the Midland, that is, to what point?—In many cases to Rugby for London. We have it on high authority that the Midland Company knew all along the scale of rates according to which Messrs. Allsopp and Sons were paying the London and North-western Railway Company. For nearly the first three years of the period the Midland Company performed the work of sending and invoicing Messrs. Allsopp and Sons' goods hence to London and North-western stations (that company having then no station at Burton) at precisely the same ratio as ours, the London and North-western Company reducing them by subsequent monthly overcharge sheets to the private scale and sending such sheets to their various stations and to the Midland Company to check the correctness of the entries. I have some examples of such sheets which I can hand in.

The witness delivered in the same, which are as follows:

Mr. J. Cosgrove.

17 April 1866.

When, afterwards, the London and North-western Company established their line in the town, the same system of private reductions from the public rate was carried on in favour of Messrs. Allsopp and Sons. We must not omit to remark that the North Staffordshire Company were also privy to this arrangement, regularly receiving the private reduction sheets upon that portion of the traffic which the Midland Company here had handed to them for passage over their line to Crewe, for the London and North-western stations lying northward of there.

15,689. (*Capt. Galton.*) Does not this part of your memorial show that it was the North-western who gave the drawback to Messrs. Allsopp, and with whom Messrs. Bass & Co. had no agreement?—That is true.

15,690. And therefore the Midland would be able to meet your argument by saying, We invoice the goods at the same price to everybody, but if the North-western give drawbacks we know nothing about it?—But they had these private overcharge sheets coming from the North-western.

15,691. (*Mr. Glyn.*) Does that sheet show the fact that the Midland made any reduced rate between Rugby and Burton?—It shows a reduced rate for the whole distance.

15,692. (*Mr. Horsfall.*) Was that private sheet sent with every shipment of goods?—The North-western would issue them to send to all their stations about once a month. With regard to the Midland they did have the sheets, but they said they did not know what the agreement was.

15,693. (*Capt. Galton.*) The North-western did not know of the agreement with the Midland, I suppose?—I cannot say; they were public rates. The Midland agreement had no private rates in it.

15,694. Then you do not charge the Midland with breaking faith with you?—Only so far as their having an agreement with us saying they would put us upon as good terms as the other traders trading in Burton, and for five years we did not know of those private sheets.

15,695. (*Chairman.*) I understand you do not complain so much of the North-western Railway Company giving a drawback to Messrs. Allsopp as of the Midland not giving some drawback to you, after having agreed to put you upon the same terms as the other traders?—It is the London and North-western who gave the drawback. We do not complain that another trader accepted the lower rates. We do not complain of Messrs. Allsopp at all; they are great friends of ours. But we complain of the Midland, in spite of having an agreement with us in which they promised to put us on as good terms as anybody else, not giving us the benefit of the rates which they knew were given to another firm. We consider that to be a breach of faith on the part of the Midland.

15,696. (*Capt. Galton.*) But Messrs. Allsopp's arrangement was with the North-western?—With the North-western, and ours was with the Midland.

15,697. Is that really the reason why you did not get the deduction, because the Midland gave you what they charged Messrs. Allsopp, and then the North-western took off the discount?—Yes, they did.*

15,698. But the Midland were not necessarily bound to participate in that?—No; it depends on their private arrangements with the London and North-western. They promised to put us on as good terms as any other railway trading in Burton, and knowing there were better terms, why did they not give them to us.

15,699. Unless you can prove that the reduction was made on the Midland portion of the railway as well as the North-western portion, can you substantiate a claim against the Midland?—We can make our claim good under this agreement, which affects to give us as good terms as any other railway does any other customer.

15,700. Can you make it legally good against them?—Yes; we have stopped 59,000*l.* from them.

15,701. (*Sir R. Hill.*) Has that been allowed by the railway companies?—There is only a question of interest left now amounting to 3,700*l.* We are now battling about the interest.

15,702. (*Capt. Galton.*) Then they admitted the claim?—Yes.

15,703. (*Mr. Horsfall.*) The charge against the Midland Company simply is this, that they have neglected to put you on the same footing as to charges that the London and North-western Company charge?—Exactly.

15,704. And then, while the London and North-western were charging a lower rate, they continued to charge you a higher one?—That is our case. The exact figures of the sum we have stopped are 58,437*l.* 12*s.* 11*d.*; those are the amounts of our carriage accounts from January last year to July inclusive.

15,705. (*Mr. Glyn.*) So far you consider it settled?—Yes. They made 13 objections to our demand in verbal argument, and when we asked them to put them into writing they reduced them to nine. There were two points, questions of principle, in dispute, but now there is only one. I think the other is virtually settled. They sent us on the 31st of last month a letter saying that they would make such a proposition as would settle the matter.

15,706. Have you a copy of the agreement?—Yes. The third clause is the important one; "The Midland "Company agrees to place Messrs. Bass and Co. "during the continuance of this agreement on as "favourable terms in every respect as any other "party trading in or with Burton, and should it at "any time hereafter (during the continuance of this "agreement) appear that any other company has, by "means of drawbacks, or otherwise, reduced the rates "(now arranged) to any other brewery, Messrs. Bass "and Co. to have the same allowance made to them "under the same circumstances, from the time such "allowance was first commenced, providing such time "was not prior to the commencement of this agree-"ment."

The witness delivered in the same, which is as follows:

MEMORANDUM of AGREEMENT between the MIDLAND RAILWAY COMPANY and BASS, RATCLIFFE, and Co., brewers, of Burton-on-Trent, for the conveyance of goods by railway to stations on the London and North-western line, branches, and leased lines.

CLAUSE 1.—Messrs. Bass and Co. engage to send their full and returned empty casks during the continuance of the agreement, by the Midland Company, at the following rates, and the Midland Company agrees to carry such goods, at such rates, including risk in loading, unloading, delivery, &c.

2. In case the London and North-western Company shall open on lease lines during the continuance of this agreement, to towns not herein mentioned, Bass and Co. shall have the option of accepting rates to such stations at the mileage rate herein named.

3. The Midland Company agrees to place Messrs. Bass and Co. during the continuance of this agreement on as favourable terms, in every respect, as any other party trading in or with Burton, and should it at any time hereafter (during the continuance of this agreement) appear that any other company has by means of drawbacks, or otherwise, reduced the rates (now arranged) to any other brewery, Messrs. Bass and Co to have the same allowance made to them under the same circumstances, from the time such allowance was first commenced, providing such time was not prior to the commencement of this agreement.

4. Subject to the above protecting clauses (with the exception of Dublin and Liverpool) the rate for Bass and Co.'s ale from Burton to the stations as under, and vice versâ, shall be calculated by the following mileage rate, station to station,

* This answer afterwards altered by witness as follows:—"No. It was the interest of the Midland Company to keep us in the dark as long as they could, which they did."

For distance not exceeding 50 miles, 2*d.* per ton, per mile.
„ „ over 50 and not exceeding 100 miles - 1¾*d.* „ „
„ „ exceeding 100 miles - 1½*d.* „ „

In addition to the station to station rate, 3*s.* 4*d.* to be charged for terminals, such rates to include delivery and collection within the ordinary limits at such places only, where the company has ordinarily performed such duties by their own teams or carting agents.

5. That the minimum rate be 8*s.* 4*d.* (say eight shillings and fourpence) including the usual delivery, but Messrs. Bass and Co. do not bind themselves to send all their goods by rails to town distant 12 miles or under from Burton.

6. That the rate for ale, Burton to Liverpool, shall be 12*s.* 6*d.* per ton, station to station, including risk in loading and unloading.

7. That the rate for ale, Burton to Dublin, shall be 22*s.* 6*d.* per ton, including sea risk and delivery to Bass and Co 's stores in Dublin.

8. All distances to be measured by the shortest railway route, and in the event of a nearer route being opened, Messrs. Bass and Co. to have a corresponding reduction in the former rates.

9. This agreement to extend to the list of stations annexed, and to any other station on the London and Northwestern line to which Messrs. Bass and Co. may require a through rate, provided it is one that is ordinarily in use for general goods traffic.

10. Ale shall be considered to weigh 12 lbs. (say twelve pounds) per gallon, including the cask.

11. The rates per ton for empty casks from all places (included in this agreement) to Burton shall be those fixed upon for ale, and where the ale rate includes delivery, the same shall include collection of empties under the same circumstances as mentioned in clause 4, within the ordinary limits. The weight of each cask to be, butt, 2 cwt., hhd. 1 cwt., barrel, ¾ cwt., kild. ½ cwt., but no charge less than 4*d.* (say fourpence) for each separate consignment.

12. The rate for staves and corn to be one penny per ton per mile, and 2*s.* 6*d.* per ton terminals, station to station, and exclusive of loading and unloading, but Bass and Co. do not bind themselves to send these goods by railway. Staves to be carried at actual weight, corn according to scale given in the present railway clearing house classification.

13. Show cards and labels to be sent free from Burton to all places included in this agreement.

14. Freights to be paid in cash as heretofore, monthly, or by bills of short dates.

15. Claims for loss or damage to be made within six days of the occurrence or the circumstances being made known to Bass & Co., or consignee.

16. Disputes to be referred to arbitration.

17. The Midland Company undertake that the utmost expedition shall be used in forwarding Messrs. Bass and Co.'s goods.

18. This agreement to take effect from the 1st January 1861, and remain in force for six years.

For the Midland Railway Company,
(Signed) JAMES ALLPORT.

(Signed) BASS, RATCLIFFE, & GRETTON.

(Signed) James Allport.
(Signed) Bass, Ratcliffe, & Gretton.

15,707. (*Sir R. Hill.*) The clause you have read does not appear to extend to any other company in the kingdom ?—Only to North-western stations.

15,708. I understand they have admitted the claims under the agreement, and that they have paid you accordingly ?—They are going to give it us from the original date. Although their agreement is January 1861, they have admitted their liability from November 1859. We being good customers to them, they say they will pay us to that date. They disputed the first 14 months, but we said that we should have to confess to the conviction that we had suffered from our connexion with them if they did not give it to us from the date of Messrs. Allsopp's agreement with the London and North-western. They do not demur to that now, but say that we shall have it from November 1859, which is our full claim.

15,709. (*Chairman.*) Have you made a similar settlement with other brewers in Burton ?—No. We, Bass & Co., have been conducting the negotiation since last summer, so that when we are settled with, no doubt all the smaller brewers will get treated with in the like manner.

15,710. (*Mr. Glyn.*) No demur has been made to that ?—No.

15,711. (*Capt. Galton.*) It all depended upon your finding out this agreement, according to which you have been treated unfairly ?—Yes.

15,712. Supposing the public had a right to see the rate books of the Midland Company, should you have discovered that ?—No, not from the Midland office.

15,713. Should you have discovered it if you had had access to the rate books of the North-western ?—Not the public rate books ; it was a private affair.

15,714. But supposing the company was bound to enter into a book every rate it gave, then would you be able to discover any private arrangement of that sort ?—Yes, that would be fair.

15,715. (*Chairman.*) But do I understand you to say that you think you would have found out this arrangement. When they charged in the first instance a larger sum and then afterwards gave a drawback reducing that to a smaller sum, would that have appeared on their rate books ?—Not if they chose to do it secretly, but if they were compelled to register it we should know.

15,716. How did this transpire ?—We heard it from various railway men. It was known to all the clerks upon the London and North-western line. The company did not do it very cleverly. The overcharge sheets used to go to every station upon the line ; I mean these sheets, reducing it from the public to the private rate, so that every station-master on the railway knew what the rate was to his own station (and they used to laugh about it) but probably he did not know what it was to other stations.

15,717. (*Mr. Glyn.*) Those sheets were used by the North-western ?—Yes.

15,718. They had no particular motive for secrecy, had they ?—Yes, they did not want the other brewers to come down upon them. It lasted five years.

15,719. They would have been very glad to have carried the goods of other brewers at the same rates ?—No, it depends upon the arrangements between them and the Midland Company. They did not want any one else to have it, that is quite evident, or we should not have been kept so many years out of it.

15,720. (*Chairman.*) In point of fact, you think that the North-western shared the spoil with the Midland ?—I do not know about the spoil. The Midland would be sorry to lose the higher rate.

15,721. But if the Midland lost the higher rate, do you not suppose that the North-western would also lose their share of that higher rate ?—Yes, no doubt.

15,722. (*Capt. Galton.*) If you had not discovered it from the station-masters at several stations on the railway, I suppose the thing might have gone on for many years more ?—Yes.

15,723. Messrs. Allsopp would never have communicated to you, I suppose ?—It was principally got from the goods station-master at Burton ; a few of the reduction sheets used to come to him regularly.

15,724. He mentioned it ?—Yes, all his clerks would know as well, but they would not have the ideas to analyze the rates, and organize them into a system. For 50 miles it was 2*d.*; between 50 and 75 miles, $1\frac{3}{4}d.$; over 75 miles, $1\frac{1}{2}d.$, per ton, per mile, whereas the public rates ranged from 11 to 105 per cent. higher, of which there is a list in the memorial.

15,725. (*Chairman.*) Will you proceed with your statement ?—"In submitting the serious cases of "injustice to which we have been subjected, we beg to "express a well founded hope that parliamentary inter- "vention is at hand to render it impossible in the future "that any railway company shall be able so far to "exceed its proper functions as to attempt by prefer- "ential rates to place the goods of any one trader at a "cheaper cost in the various ports and markets of the "country to the corresponding disadvantage of others "engaged in the same town, and in the same depart- "ment of enterprise. We conceive that railways are "legalized in the interest of the public as well as in "that of the companies, that the Legislature could never "have contemplated on the part of few groups of indi- "viduals (who now have the monopoly of the carrying "business) such an unfair and dangerous interference "with the freedom of trade, interference implying the "assertion of a principle which, if carried out, would "place it in the power of the railway body to dictate "the terms and conditions of the whole trade of the "country."

15,726. (*Capt. Galton.*) How would you guard against such a system as that ?—By preventing secret rates altogether.

15,727. How would you prevent them ?—By legislative enactment.

15,728. Are they not now prohibited by legislative enactment. Is it not the case that everybody is entitled to have his goods carried at similar rates under similar circumstances ?—Yes.

15,729. In what manner would you carry into effect a law which would prevent the secret arrangements taking place where it was to the interest of parties to make secret arrangements ?—By making it legal that there should be some strict government control over the railways.

15,730. Do you mean by inspecting the books of the companies. I want to know exactly how you would prevent their carrying at these rates so long as the railways are in the hands of the present directors ?—Cannot you make the rule very stringent ? We believe that it ought to put one trader on the same footing as another. Could you not make it more strict than it is now ? Could they not be subject to a fine if they do infringe in this way ?

15,731. I want to gather from you what you think is the best way of meeting this abuse ; what suggestion have you to offer upon the subject ?—That the rates should be registered publicly, and that they should be allowed no secret books whatever. If they chose to give a large trader a rebate or discount the same as other mercantile firms give their customers, they should be at liberty to do so. Every such one then might then have his 5 or 10 per cent. allowed off. It should also be allowed to small traders if they could guarantee, collectively, as much traffic as the large traders. We think it is only fair to the small traders that they should be dealt with in that manner.

15,732. (*Mr. Horsfall.*) Do you think the small traders would object to the principle of giving a preference to the larger traders ?—They might, unless it was known that a collection of small traders could obtain the same terms by guaranteeing in their corporate capacity, as it were, as much traffic as the larger traders. That would satisfy them.

15,733. (*Capt. Galton.*) Then you think that giving the public access to the rate books of the company, would meet the grievances of which you complain ?—Yes.

15,734. (*Mr. Glyn.*) I understood you to go rather further than that, you wish that arrangements which are now considered private should be made public, and notice given at the stations of them ?—Yes.

15,735. (*Capt. Galton.*) In fact there should be no private arrangements ?—No, and if there is an allowance made, the trade should know of it, and it should not be concealed in the mode we complain of.

15,736. (*Chairman.*) How would you inform the trade ?—I would leave it to the trade to find out. I would compel the companies to show any trader what the rates were to any place, both the general and the special rates, and they should be entered in a rate book kept for the purpose.

15,737. In fact, you would be satisfied, if any person were to go to a station and ask to see the rate book, if he were allowed to do so ?—Yes.

15,738. (*Mr. Horsfall.*) You would have that done at every station ?—I would have that done at every station.

15,739. (*Chairman.*) What is your next head ?—The next head is rather a serious matter, "terminal charges and their abuses." Messrs. Bass & Co. have claimed from the Midland Railway, up to the 30th of January 1865, from the 1st of July 1862, 8,704*l.* 18*s.* 9*d.* for terminals, which we have been charged and ought not to have paid. There is a similar estimated claim of 8,000*l.*, making a total of 16,704*l.* 18*s.* 9*d.*; the estimated claim of the other brewers is at least 14,000*l.*, or say 30,000*l.* in all.

"The above amounts represent a moderate estimate of the claims due to us, as a drawback at 2*s.* 6*d.* per ton difference, between 4*s.* and 1*s.* 6*d.* the station to station terminals. Messrs. Bass & Co., who have already sent to the Midland Company an account for part of the term, seven years, for which they intend claiming, have given that company notice they will pay no more carted rates, but demand station to station rates, we are about to follow a like course. Rule 69 of the railway clearing house (to whose rules all the associated railways subscribe) states that an allowance at the rate of 8*s.* 6*d.* per ton in London, and 4*s.* per ton in the country, is made for the terminal expenses on goods traffic when carted, and 1*s.* 6*d.* per ton both in London and the country when not carted. For conveyance of our ales hence to stations on railways beyond our local lines, we are paying and have hitherto paid what are termed carted rates. No carting has ever been done here by the company. Those of us who have no private lines in connection with the railway, cart the ale to the station ourselves. Under those circumstances we are surprised to learn that the Midland Company has for a number of years been receiving in addition to their mileage proportion of the through rates paid by us, and divided by the clearing house, the sum of 4*s.* per ton for their Burton terminal charges, precisely the same as the companies owning the destination stations, where carting actually is performed. A glance at the tabulated statement, under the head of unequal rates, will show on the other hand, that upon the division of the very few station to station rates, we have namely : at Glasgow and on the London, Brighton, and South Coast Railway, the company are content to receive the proper allowance of 1*s.* 6*d.* per ton for Burton terminals. The work performed by the companies at this end is precisely the same, whether they obtain 4*s.* or 1*s.* 6*d.* We have heard of traders in other places claiming a drawback of 1*s.* 6*d.* per ton, indeed we have done so ourselves, in the instance of hops arriving at delivery rates, when the carting is saved to the company. But in the case of our ale, the mischief is that through the terminals being concealed in the gross charges we were unaware that they included a carted terminal at Burton. In calling your attention to the vague and unsatisfactory manner in which terminals are now levied, we earnestly beg that you will recommend that the railway companies shall for the future be compelled by legislative enactment, to state in a fair and open way, separately from the mileage rates, what are their terminal charges on the various classes of goods, and the particular service or services they include. May we also beg you will cause the secretary of the railway clearing house to be invited to give evidence on this branch of a subject so important to the trading interests of the country generally."

15,740. (*Capt. Galton.*) Upon what subject do you wish the secretary of the clearing house to give evidence before this Commission ?—We do not care about it as regards ourselves, because we can prove this matter without his assistance.

15,741. Merely on the point of the terminal charged ?—Yes, and also with reference to the rates, I will show you how necessary it will be to call him, with regard to the question of rates. I believe you are sending out forms to the different railway companies, to send you their rates to different places. They manage to have pretty nearly equal rates on their own lines, but if you ask them what are their rates between their own railway and other railways, you will be amazed not only at the differences and inequalities generally, but the number and variety of rates they receive for the same class of goods to the same places, viz., the points of junction with neighbouring companies.

15,742. (*Mr. Horsfall.*) How would you propose to remedy the evil with regard to terminals ?—I would propose that they should be compelled by legislative enactment to state plainly what are their terminals and what are their mileage rates, and to separate one from the other in a fair and plain way.

15,743. (*Mr. Glyn.*) Would you have both charges stated separately in the invoice ?—Not necessarily in the invoice. They need not be charged separately.

15,744. (*Sir R. Hill.*) You think they should be contained in the rate-book ?—Yes, which should be accessible to the public. If I asked them what their rate was and they replied 30*s.*, and then I asked them

Mr. J. Cosgrove.

17 April 1866.

what was their mileage rate and what their terminals, they ought to be compelled to tell me.

15,745. (*Capt. Galton.*) Would you have maximum terminals fixed by Act of Parliament?—Yes, and fair terminals. These terminals are very fair. We do not object to them, although we could do it cheaper ourselves.

15,746. You mean the carting?—Yes; there is the carted terminal of 4*s.* and the station to station terminal of 1*s.* 6*d.*, that is a difference of 2*s.* 6*d.*; whereas we can get the carting done almost anywhere for 1*s.* 6*d.*

15,747. Is it open to you to cart yourselves if you choose?—Yes, the brewers at Burton do cart, unless they have sidings in connexion with the railways.

15,748. Do you know that the breweries of Burton have access by means of lines of their own to the railways?—The large brewers have, such as Allsopp's, Bass & Co., Salt & Co., the Burton Brewery Company, Ind, Coope, & Co., and Worthington & Co.

15,749. In all cases you would maintain that the terminal should cover the interest on the cost of the station and the work done in moving the railway trucks on to your sidings?—Yes; it should be a station to station terminal. 1*s.* 6*d.* is a sufficient terminal; the companies are, in fact, satisfied with that. For instance, on the Glasgow rate, the clearing house only allows them 1*s.* 6*d.*, so that they are only getting 1*s.* 6*d.* on this traffic, and for ale going to any other places they would get 4*s.*, as Burton terminal allowance.

15,750. If you find the carting yourselves they would not charge you the 4*s.*?—Yes they do at the Burton end. We never found out anything about it until lately. It is upon such cases we are claiming 2s. 6d. per ton drawback.

15,751. (*Chairman.*) In point of fact are there not sidings running from the station at Burton into the works of the principal breweries?—Yes; the brewers make their own lines to the Midland system.

15,752. In fact there is not much carting?—No, there is no carting, except by the small brewers, who, having no private lines must cart their ale to the station. At the time we sent in our claim Messrs. Allsopp were getting 9*d.* per ton for loading and unloading, and Messrs. Bass & Co. were getting nothing. I find it is stated in the memorial, "During "the period claimed for, not only did we not receive "a farthing, but were perfectly unaware that we had "a right to payment for such performances, that our "neighbours were having an allowance of any kind, "or that the Midland Company were parties to "making such allowances elsewhere. The rules, "however, of the Midland association (formed by "the Midland, London and North-western, North-"eastern, and other companies) show that such allow-"ances have for many years past been made by the "railway companies to parties having sidings from "their lines, *e. g.* Messrs. Watts & Co., Soho, 7*d.* "per ton; Messrs. Murcott & Wright, 1*s.* per ton; "and W. Williams Albion, 6*d.* per ton." Those are the rates of the Midland Association, therefore the Midland Company must have known that we were entitled to something for our own loading and unloading, even if they did not know the exact sum allowed by the London and North-western Company to Messrs. Allsopp & Sons.

15,753. (*Capt. Galton.*) Your complaint is that the Midland Railway Company have not acted fairly by the brewers of the town?—Yes, either as regards rates or loading and unloading allowances, and in mulcting us in 2s. 6d. per ton in cartage terminal at Burton, when no carting has ever been done by them. There are three charges against them.

15,754. (*Mr. Horsfall.*) Who is the individual connected with the Midland Company with whom you negotiated with regard to these charges?—Mr. Allport.

15,755. (*Chairman.*) Does the sum of 77,000*l.* which you claim as a drawback from the Midland Company, include the overcharges for terminals as well as the overcharges for rates?—The North Stafford Company will have to pay a small portion of the 77,000*l.* It includes overcharges on rates, and the 9*d.* for loading and unloading, but not the 2*s.* 6*d.* terminals. The latter is a separate matter. The former come under the head of favouring rates.

15,756. In fact you claim a larger drawback than 77,000*l.*, taking the terminals into consideration?—The 77,000*l.* comes under the head of favouring rates. We claim in addition 30,000*l.* under the head of terminals. We intend to claim for seven years, but we have only claimed for three years, it takes so long to make out the accounts. It makes in all 30,000*l.*, that is the 2*s.* 6*d.* terminals.

15,757. (*Mr. Horsfall.*) Do you think Mr. Allport was cognizant of those different charges, or was he in ignorance like yourselves?—He must have been cognizant of the overcharges in the rates, because his goods manager, in his presence and in the presence of Mr. John Gretton and myself, admitted that he did know of these private reduction sheets.* They may have had a difficulty in getting the actual text of Allsopp's agreement from the North-western, but knowing the rates, there remained but loading and unloading allowances to make. As they are parties to making them elsewhere, they must have known there was something due to us. If you please, I can read two letters which we sent Mr. Allport on the subject of the 2*s.* 6*d.*† The first is this,—

"Burton-on-Trent,

"DEAR SIR, "19th March 1866.

"WE herewith beg to hand you an account of the weights of ale forwarded to and received from the stations of the various foreign railways by us during the three years ending June 30th, 1865, charged at carted rates, from which you have been and are still receiving through the clearing-house a terminal allowance of 4*s.* per ton, which allowance includes cartage in Burton, whereas no such service is performed by you here.

"We claim 2*s.* 6*d.* per ton, the difference between 4*s.* and 1*s.* 6*d.* which respectively represent the terminal allowance made on 'carted' and 'not carted' traffic.

"We beg your early attention to the subject of these rates, and would suggest as the only means of correcting for the future the irregularity complained of, that they be at once altered to station to station rates.

"We beg you also to understand that we shall henceforth decline to pay the collected and delivered rates as they at present stand.

"Yours faithfully,

"(Signed) BASS, RATCLIFF, and GRETTON.

"J. Allport, Esq.,

"Midland Rail Company, Derby.

"P.S. You will, no doubt, remember reference being made to this matter on 22nd December last, when Mr. J. Gretton and our Mr. Cosgrove were at your office.

"J. C."

And on the 9th April, we sent him this letter:

"Burton-on-Trent,

"DEAR SIR, 9th April 1866.

"WITH reference to our letter of 19th ult., Mr. Walklate having admitted to our Mr. Cosgrove on Saturday last, that you are receiving upon our traffic to foreign railway stations 4*s.* per ton, the carted allowance for your Burton terminal, we beg to remind

* Mr. Cosgrove subsequently added: "We also know on the highest authority the London and North-western Company did send the sheets to the Midland."

† The witness afterwards added the following note: "In reference to the 2*s.* 6*d.* we claim from the 4*s.* carted terminal although Mr. Allport, Mr. Walklake his goods manager, and Mr. Swarbrick his accountant, distinctly denied on 22nd Dec. last to Mr. John Gretton and Mr. Cosgrove, that they had ever received 4*s.* for a Burton terminal on ale, Mr. Walklate now actually admits they have been receiving such allowances."

you that in arranging for station to station rates for our future traffic to those places, we cannot be satisfied with a less reduction than the 5*s.*, difference between the 8*s.* and 3*s.* terminals, nor can we remain passive if it is at all attempted to fritter away any portion of that amount by rearranging for yourself and your neighbouring companies any increased mileage allowance.

"Permit us to say we ask no more than our strict right, nor will we take less.

"We are faithfully yours,

"(Signed) Bass, Ratcliff, and Gretton.

"James Allport, Esq., Derby."

It is competent to them under the present irresponsible powers in settling the matter to confiscate a portion of this 2*s.* 6*d.* at either end. We wish to have a station to station rate, and do our own carting at the destination stations. We can do it at 1*s.* 6*d.* so that we should save 3*s.* 6*d.*; but if they chose to lay their heads together, they could re-mile it and deprive us of what really belongs to us.

15,758. (*Capt. Galton.*) How can you prevail upon them not to do that?—Look at the morality of the thing; it is not right. The present railway system is wrong altogether. We want some state control over the directors and managers. In fact they are our masters instead of being our servants.

15,759. But still you do not object to their getting rates which remunerate them?—I do, if they are beyond the cost of conveyance, and a fair profit added.

15,760. Are they entitled to charge you the maximum parliamentary rates?—As far as being entitled goes they are; but those rates are very wide of the mark.

15,761. How much less do they charge you below what the parliamentary rate will be?—Beer is not mentioned in the tolls; but I will take sugar which is. Above 40 miles the maximum rate allowed by Parliament is 2*d.* We were paying over 2*d.* per mile under the old rates to many of the London and North-western stations. Under the secret rates it is 1½*d.* We were paying over the full maximum rates; that is, taking sugar to be in the same class as beer; and beer ought not to be in a higher class, because sugar is three or four times the value of beer, taking a ton of sugar and a ton of ale; so that I think it would be fair to put ale in that class—that is, the class upon which 2*d.* per ton per mile is allowed as a maximum rate.

15,762. What do you consider the terminal charge should cover?—All terminal services. In our case we do the loading ourselves. People who have their own private sidings do the loading and unloading on their own premises. We do our own hauling likewise. We (Bass & Co.) have three engines running about our yards. We haul down to the company's sidings; so that they have nothing to do but just to sort the waggons, marshal the trains, and take them away.

15,763. Do you consider it should cover any interest on the cost of building the station?—No; any more than I should consider fares and rates should have anything to do with that.

15,764. The question of terminals has been put to us in this way, that railway companies are entitled to be remunerated for performing all those services which an agent would perform if they merely take the goods with their engines from one station to another and transfer the goods to an agent at the station, who would have his own yard and his own arrangements for delivering the traffic?—In that case they divide the terminal between them.

15,765. The railway companies say that they ought to be remunerated by the terminal charge for all that class of work?—If it is done by persons like themselves they do not expect a whole terminal; they only expect a portion of it. Their station to station traffic terminal is 1*s.* 6*d.*; out of that they give us 1*s.* 1½*d.*; 9*d.* for loading, and 4½*d.* for haulage. They in fact do no work, beyond what I have previously stated.

15,766. The railway companies claim that they are entitled to receive a payment out of the terminal as interest upon the money spent in building their station and constructing their sidings, goods sheds, and platforms?—No; I take it it includes a payment for services, not interest on the money. The rates for passengers or goods ought not to be arranged according to capital. Capital has little to do with them in my opinion. When they are in advance of the *cost* of conveyance it is a mere question of numbers of passengers or tons of goods, what prices pay best.

15,767. But still rates must be arranged in some degree with reference to capital; the railway companies must receive a fair profit on the capital invested, or there will be no railways constructed?—Yes.

15,768. Therefore, if a railway was made in a district where there was a very small amount of traffic, they would be compelled to charge very much higher fares than in a district where there was a very large amount of traffic; so that the fares and rates must have some reference to capital?—Yes.

15,769. (*Chairman.*) Do I understand you to say that you think a railway company has no claim to be remunerated for the capital which it has expended upon its goods sheds?—Of course it has a claim to be remunerated for that. I do not mean to say that at all.

15,770. Out of what fund would that remuneration come?—Out of the general profits. Terminals I take to include services only, the clearing house allowances being the same under all circumstances, whether at stations where there is a small or a large outlay.

15,771. You do not think that a railway company has any right to charge, in the terminals, interest upon capital laid out upon stations?—I do not know how they arrange it, or what it can come out of, (except the general profits,) but I take the terminals to be for services only, because they divide them with us; in that way they give us the 9*d.* and 4½*d.* out of 1*s.* 6*d.*

15,772. (*Mr. Glyn.*) You do all the work and furnish the sidings?—We do all the work. We do not furnish the railway sidings, but we find our own. We join their sidings by means of our own railways.

15,773. In point of fact the railway sidings are not used by your traffic except as a passage to get to your own sidings?—The railway sidings are used in common; they are used by other brewers.

15,774. But in any case they only use the sidings for the purpose of passing the beer into your yard?—Yes; they use them for placing goods upon them until we fetch them away.

15,775. Then they do use them for the purpose of sending away traffic?—Yes.

15,776 (*Chairman.*) In point of fact I understand from you that the company performs no services for the 1*s.* 6*d.*, which you admit they have a right to charge you?—They perform comparatively little. They allow us 1*s.* 1½*d.*; so that if they get 1*s.* 6*d.*, they have only 4½*d.* left for themselves. They allow us 1*s.* 1½*d.* out of the 1*s.* 6*d.*; we have never had it yet although we claim it, because Messrs. Allsopp have it. We do nearly all the station work ourselves; we have a railway station, in fact, of our own.

15,777. For the performance of what service are you content to give the balance of 4½*d.* on the terminal to the company?—It does not rest with us. We are expected to be content with anything the railways give us. We get 9*d.* for loading, and 4½*d.* for drawing. We have had no hand in the arrangement, in fact it is a godsend to us.

15,778. Will you proceed with your evidence with regard to unequal rates?—It is very long evidence indeed, we have taken a review of all the principal railways in the kingdom. In the memorial there is a statement showing the inequalities in the rates for ale from Burton-on-Trent to a number of stations on the principal railways in the kingdom, *viâ* the Midland, the rates being divided according to the railway clearing house rule. If I refer to the summary,

Mr. J. Cosgrove.

17 April 1866.

probably that will suffice. We have reduced the rates so as to show the inequality of mileage on the different railways. The rate per mile on the Scottish North-eastern ranges from 6-10ths of a penny to 8-10ths of a penny. The charge for 100 miles ranges from 5*s.* 4*d.* to 6*s.* 11*d.*, and the per-centage varies up to 29¾; the average of the whole line per mile is 7-10ths of a penny, and per 100 miles 6*s.* 3*d.* The rate per mile on the Glasgow and South-western ranges from 8-10ths of a penny to 9-10ths of a penny; the charge for 100 miles ranges from 6*s.* 9*d.* to 7*s.* 11*d.*; the per-centage varies up to 17¼; the average of the whole line per mile is 8-10ths of a penny, per 100 miles 7*s.* 1*d.* The rate per mile on the Scottish Central ranges from 7-10ths of a penny to 9-10ths of a penny; the charge for 100 miles ranges from 6*s.* 3*d.* to 8*s.*, and the per-centage varies up to 28; the average of the whole line per mile is 8-10ths of a penny, and for 100 miles 7*s.* 2*d.* The rate per mile on the Caledonian ranges from 7-10ths of a penny to $1\frac{1}{10}d.$; the charge for 100 miles ranges from 6*s.* 3*d.* to 9*s.* 3*d.*, and the per-centage varies up to 48; the average of the whole line per mile is 9-10ths of a penny and per 100 miles 7*s.* 7*d.* The average of group is 7*s.* The rate per mile on the London and South-western ranges from 8-10ths of a penny to $1\frac{1}{10}d.$; the charge for 100 miles ranges from 7*s.* 1*d.* to 9*s.* 3*d.*, and the per-centage varies up to 30½; the average of the whole line per mile is 9-10ths of a penny, and for 100 miles 8*s.* The rate per mile on the North British ranges from 8-10ths of a penny to $1\frac{2}{10}d.$; the charge for 100 miles ranges from 6*s.* 8*d.* to 10*s.* 7*d.* and the per-centage varies up to 58¾; the average of the whole line per mile is 9-10ths of a penny, and for 100 miles 8*s.* The rate per mile on the Furness ranges from 8-10ths of a penny to $1\frac{1}{10}d.$; the charge for 100 miles ranges from 6*s.* 11*d.* to 9*s.* 8*d.* and the per-centage varies up to 39¾; the average of the whole line per mile is 1*d.* and for 100 miles 8*s.* 1*d.* The rate per mile on the London, Chatham, and Dover is 1*d.*; the charge for 100 miles ranges from 8*s.* 2*d.* to 8*s.* 11*d.*, and the per-centage varies up to 9; the average of the whole line per mile is 1*d.*, and for 100 miles 8*s.* 4*d.* The average of group is 8*s.* 1*d.* That shows a per-centage over the first group of Scotch lines of 15½. The memorial proceeds to state:—

"The summary and foregoing detailed statements show, firstly, the great inequalities existing in the rates between Burton and the various stations upon any one given railway and the curious and anomalous fact of the home railway company, the Midland, being in receipt in so many instances of a variety of rates to one place, viz., the various points of junction with the other lines; as instances upon our goods proceeding to North-eastern stations, they would obtain between Burton and their Normanton junction rates of 1*d.*, $1\frac{1}{10}d.$, $1\frac{2}{10}d.$, $1\frac{3}{10}d.$, and $1\frac{4}{10}d.$, per mile, the last being 36½ per cent. higher than the first. Upon Lancashire and Yorkshire traffic they receive 10 different prices per mile between Burton and their Oakenshaw junction; upon the Manchester, Sheffield, and Lincolnshire Railway a similar variation to their Eckington and Lincoln junctions; while upon traffic to Great Northern stations they are obtaining between Burton and their Nottingham and Hitchin junctions the astounding variation of rates from $1\frac{4}{10}d.$ to $2\frac{9}{10}d.$ per mile, or 109¼ per cent. difference, and so on with regard to freights handed over to the other companies. Such diversity of charges to one place can surely admit of no explanation on the ordinary principles of commercial dealings; as a triumph, however, of the present system of railway administration, we call special attention to them. Secondly, inequality of charges, as between one railway and another. Why should the rates from Burton to the group of lines, London and South-western, North British, Furness, and London, Chatham, and Dover, be 15½ per cent. higher than the Scotch group; the London, Brighton, and South Coast, Maryport and Carlisle, South-eastern, and Whitehaven and Furness, 29¾ per cent. higher; the North Devon, Great Western, and North-eastern 46¼ per cent. higher; the Lancashire and Yorkshire, and Manchester, Sheffield, and Lincolnshire, 63 per cent. higher; and finally, the Cambrian, and Great Northern 121¼ per cent. higher?"

15,779. (*Capt. Galton.*) Is not the inequality in that case because the beer going to Scotland has to compete with other Scotch beer, and your beer would not be sold at all unless it were to go to Scotland at that low rate?—No. I do not think they study the exigencies of the trade in common; they study their own interest first. The exigencies of the trade are secondary questions altogether with them.

15,780. Do they study the arrangement by which they can get the largest amount of traffic?—No doubt they do.

15,781. Is that not to the interest of the trade also?—No, not in all cases, our interests are made subservient to theirs when there is the smallest gain to be had. That is to a seaport, that would not affect Scotland, because that is to Glasgow. We got our rate to Glasgow reduced by sending our ale to Liverpool and thence by steamer. They then gave us a little of this terminal, which lets in a little light upon the general question of terminals. I do not suppose the reduction would alter the mileage at all. They are only getting 1*s.* 6*d.* upon that Glasgow traffic.

15,782. (*Mr. Horsfall.*) What reason do they assign for the difference in the charge from Burton to Normanton? You say upon the same line there is a variety of charges for the same distances?—There are 10 different prices between Burton and Oakenshaw, the rates varying so much between one station and another on that one railway. The clearing house gives a different mileage for each station on the Lancashire and Yorkshire. I can understand them having two different rates, but I cannot understand how they manage to have 10 different rates. I can understand them having a lower rate, and therefore having to participate in a lower charge between Burton and Oakenshaw, because rates generally decrease for long distances, so that if they had a long distance to take it I could understand it.

15,783. Do they have 10 different rates for the same thing between Burton and Oakenshaw?—Yes. The Lancashire and Yorkshire get 10 different rates also from the Oakenshaw junction to their various stations. They vary as much as 91½ per cent. The lowest rate between Burton and Oakenshaw is 9-10ths of a penny per mile, and the rate ranges from that to $1\frac{8}{10}$ of a penny per mile. The Midland Company get that as between Burton and Oakenshaw.

15,784. (*Mr. Glyn.*) That is to say, their proportion of the whole amount received from the trader varies by those figures?—Yes.

15,785. (*Capt. Galton.*) That is to say, the rate from Burton to Fleetwood would be probably a lower rate, because there is the sea competition, than the rate between Burton and Rochdale, for instance?—Yes.

15,786. Therefore, if you divide the mileage in equal proportions, the proportion that goes to the Midland between Burton and Oakenshaw would be different?—It would be less in that case. Those quoted in Memorial are not to a port at all. These are 10 different rates between Burton and stations on the Lancashire and Yorkshire Railway.

15,787. It is not because there is some local competition of beer which would prevent the beer being sold so favourably unless a low rate was given?—No; there can be no reason of that kind for these 10 rates. I will just refer to the details of the Lancashire and Yorkshire Railway to see what the stations are. Upon the Lancashire and Yorkshire Railway, between Burton and Rochdale by the Oakenshaw route, the through rate, including delivery, is 16*s.* 8*d.*; the net amount on deducting 4*s.* for terminals at each end is 8*s.* 8*d.* The distance is 110 miles. The rate per mile is $\frac{9}{10}$ of a penny. The charge for 100 miles is 7*s.* 10*d.* The per-centage showing inequalities of charges over Rochdale 22¼. Between Burton and Over-Darwen by the Oakenshaw route the through rate, including delivery,

is 20*s.* The net amount on deducting 4*s.* for terminals at each end is 12*s.* The distance is 125 miles. The rate per mile is $1\frac{1}{10}$ of a penny. The charge for 100 miles is 9*s.* 7*d.* The per-centage showing inequalities of charges over Rochdale $22\frac{1}{4}$. Between Burton and Blackburn by the Oakenshaw route the through rate, including delivery, is 20*s.* The net amount on deducting 4*s.* for terminals at each end, 12*s.* The distance is 121 miles. The rate per mile is $1\frac{2}{10}$ of a penny. The charge for 100 miles is 9*s.* 11*d.* The per-centage showing inequalities of charges over Rochdale, $26\frac{1}{2}$. Between Burton and Accrington by Oakenshaw the through rate, including delivery is 20*s.* The net amount, deducting 4*s.* for terminals at each end, 12*s.* The distance is 116 miles. The rate per mile is $1\frac{2}{10}$ of a penny. The charge for 100 miles is 10*s.* 4*d.* The per-centage showing inequalities of charges over Rochdale $31\frac{3}{4}$. Between Burton and Burnley by Oakenshaw the through rate, including delivery, is 20*s.* The net amount deducting 4*s.* for terminals at each end is 12*s.* The distance is 110 miles. The rate per mile is $1\frac{3}{10}$ of a penny. The charge for 100 miles is 10*s.* 11*d.* The per-centage showing inequalities of charges over Rochdale is $39\frac{1}{4}$. Between Burton and Clitheroe the through rate by Oakenshaw, including delivery, is 23*s.* 4*d.* The net amount on deducting 4*s.* for terminals at each end is 15*s.* 4*d.* The distance is 130 miles. The rate per mile is $1\frac{4}{10}$ of a penny. The charge for 100 miles is 11*s.* 10*d.* The per-centage showing inequalities of charges over Rochdale is 50. Between Burton and Denby Dale by Oakenshaw the through rate, including delivery, is 20*s.* The net amount on deducting 4*s.* for terminals at each end is 12*s.* The distance is 96 miles. The rate per mile is $1\frac{5}{10}$ of a penny. The charge for 100 miles is 12*s.* 6*d.* The per-centage showing inequalities of charges over Rochdale is $59\frac{1}{2}$. Between Burton and Holmfirth by Oakenshaw the through rate, including delivery. is 20*s.* The net amount on deducting 4*s.* for terminals at each end is 12*s.* The distance is 93 miles. The rate per mile is $1\frac{5}{10}$ of a penny. The charge for 100 miles is 12*s.* 11*d.* The per-centage showing inequalities of charges over Rochdale is $64\frac{3}{4}$. Between Burton and Brighouse by Oakenshaw route the through rate, including delivery, is 20*s.* The net amount on deducting 4*s.* for terminals at each end is 12*s.* The distance is 86 miles. The rate per mile is $1\frac{6}{10}$ of a penny. The charge for 100 miles is 13*s.* 11*d.* The per-centage showing inequalities of charges over Rochdale is $77\frac{1}{2}$. Between Burton and Pontefract the through rate by Oakenshaw route, including delivery, is 20*s.* Net amount deducting 4*s.* at each end for terminals is 12*s.* The distance is 80 miles. The rate per mile is $1\frac{8}{10}$ of a penny. The charge for 100 miles is 15*s.* The per-centage $91\frac{1}{2}$. A reduction of from $8\frac{1}{4}$ to 29 per cent. has been made in the above rates since December 1865. Empty casks charged at same rate per ton as full.

15,788. Then they seem to charge just the same gross amount to each of those places, which will work out a low mileage rate?—Yes; in eight instances they charge 20*s.*

15,789. Is not that because the beer will bear that price to enable it to be sold at those places, and perhaps if they put on a higher rate to any of those towns the beer would not have a sale?—They in that sense study our circumstances; that is what we object to. We do not study to tax the degrees of profit of our customers at all in selling our goods.

15,790. They study how much they can get out of you?—Yes; they test our ability to pay, which we object to as being unsound in principle.

15,791. Then you want uniformity of rates for beer under all circumstances?—I think uniformity of rates under the present system as impossible as a square circle.

15,792. Do you think it would be better for the trade to have a uniform mileage rate all over the country?—It would be better to have a uniform mileage rate all over the country, if it could be done, but if not, I would like a modified uniformity. I have paid some attention to this matter, and I think if the Legislature could induce railway companies to adopt an extension of the amalgamation principle, it would be for the public advantage, that is, supposing the Act of 1844 is not carried out they should be induced to amalgamate under Government control. I take the 13 first-class railways, but I would eliminate from those the four bad paying ones; I would take the nine that do pay well, and I would establish uniform rates upon those lines. Those nine lines run through districts containing great and growing industries, large towns, and commercial centres with busy, active populations, such as no other country on earth possesses. Having these elements of a high and expanding traffic, I think under the stimulus of lower and equal rates they would soon pay better dividends than under the present system of high and unequal rates.

15,793. (*Chairman.*) What do you mean by a modified uniformity?—If you cannot have a general uniformity, which I hold to be impossible under the present disjointed and sectional system of management, you might have it existing in the districts served by these nine first-class railways. The united systems of these nine railways receive about two-thirds of the revenue of all the railways. If you could do that, you would at once have gone a long way towards a reform of the whole in getting two-thirds adjusted.

15,794. (*Sir R. Hill.*) Do you propose absolute uniformity over the whole of those 13 first-class railways?—I would eliminate from this scheme the four bad paying ones, namely, the Great Eastern, the Great Western, the Manchester, Sheffield, and Lincolnshire, and the North British. The other nine ought to be bound to enter into an amalgamation, subject to Government control.

15,795. Over certain lines you propose that there shall be an absolutely uniform rate?—I do.

15,796. Which do you mean, an absolutely uniform rate, or a uniform maximum rate?—I mean a uniform rate suitable to the trade. Of course there would have to be a committee of gentlemen appointed, composed of men eminent in the public service, the railway, and commercial worlds, to consider the circumstances of each of the staple trades of the various districts, and to settle what reduction shall be fair.

15,797. When that fair rate is arrived at, do you propose that it should be made the maximum or the actual charge?—I would say the maximum. That would not prevent them reducing it if they felt inclined. I would offer no opposition to a reduction of rates.

15,798. (*Lord Stanley.*) Do I understand you to mean by a uniform rate, that it should be a rate which should not in any case be reduced?—No; I would not object to a reduction.

15,799. (*Capt. Galton.*) But then uniformity would cease, would it not?—Yes.

15,800. (*Lord Stanley.*) Then you mean a maximum rate, but not necessarily a uniform rate?—Yes, but not such high maximum rates as the present.

15,801. (*Sir R. Hill.*) You propose, in fact, that the maximum rate should be lowered?—Yes, and leave less room for these violent variations.

15,802. (*Chairman.*) Do I understand you to go so far as to say that they should be bound to charge a mileage rate for 100 miles at the same rate as if it were for only 20 miles?—No; perhaps I had better read our propositions on that head. I have written them down carefully under the head of "Proposed "Rates."

Present rates. "London and North-western:—For all distances under 50 miles, 2*d.* per ton per mile; over 50 miles and under 75 miles, $1\frac{3}{4}d.$ per ton per mile; over 75 miles (except London and Dublin), $1\frac{1}{4}d.$ per ton per mile. Minimum rate $\frac{3}{4}d.$ per ton; no greater charge than 15*s.* for the first 167 miles. For distances over 167 miles at the same proportion. Empty casks to be charged at the same rate per ton as when full. North Staffordshire.—The same as the London and North-western, according to distance. Empty casks to be charged at the same rate as when full. Midland Rail-

Mr. J. Cosgrove.

17 April 1866.

way.—1½*d.* per ton per mile; minimum rate 5*s.* per ton. Empty casks to be charged at the same rate as when full. The above rates to include station to station terminals. Rates between Peterboro' and Great Eastern stations for Burton ale, two-ton lots, 1½*d.* per ton per mile, minimum rate 5*s.* per ton, maximum rate 11*s.* 8*d.* per ton. Empty casks carried free throughout the system. Those are local rates for stations upon their own lines."

Then I have got "The proposed rates upon local and foreign lines. Ale rate, Burton to London, to be 10*s.* per ton including terminals, as at present. Empties to be returned free, as upon the Great Eastern, Lancashire and Yorkshire, all railways out of Liverpool and Manchester, to certain districts of Lancashire and Yorkshire, and from certain stations upon the South-eastern railway. That the minimum rate be 3*s.* 4*d.* per ton, with a progressive rate of 1½*d.* per ton per mile, not to exceed 11*s.* 8*d.*, as upon the Great Eastern Railway. Empty casks to be carried at one-half the above rates from all places except Liverpool, which should be free, as in the case of London. These rates to include station to station terminals. For distances above 140 miles, 1*d.* per ton per mile; above 200 miles, ¾*d.* per ton per mile, or $\frac{8}{10}d.$, as at present charged to Scotch lines. These last rates to have the station to station terminal charges of 3*s.* added. Empty casks to be carried at one-half the above rates."

I will now show the actual rates on all the ale to London. From Burton to London by the Midland Railway it is 14*s.* 2*d.* per ton for 122 miles, which is at the rate of $1\frac{4}{10}d.$ per mile, the charge for 100 miles being 11*s.* 7*d.* From Newark to London the rate for ale collected and delivered is 17*s.* 6*d.*, the amount deducted for cartage in London is 2*s.* 8*d.*, in the country 1*s.* 6*d.*, making a total amount, deducting the cartage, 4*s.* 2*d.*, that reduced to station rates is 13*s.* 4*d.*, the distance is 120 miles, the rate per mile is $1\frac{3}{10}d.$ the charge for 100 miles being 11*s.* 1*d.* The per-centage of Burton rate over those from other stations is 32¼. From Leeds to London the rate for ale collected and delivered is 21*s.* 8*d.* The amount deducted for cartage in London is 3*s.* 4*d.*, in the country 1*s.* 6*d.* making the total amount deducted for cartage 4*s.* 10*d.*, which reduced to station to station rates is 16*s.* 10*d.* The distance is 192 miles; it is at the rate of 1*d.* per mile. The charge for 100 miles is 8*s.* 9*d.* The per-centage of Burton rates over those from other stations is 32¼. From Sheffield to London the rate for ale collected and delivered is 17*s.* 6*d.*; the amount deducted for cartage in London is 2*s.* 8*d.*, in the country 1*s.* 6*d.* making the total deduction for cartage 4*s.* 2*d.*, that reduced to station to station charges is 13*s.* 4*d.*, the distance is 116 miles, the rate per mile is 1*d.*, the charge for 100 miles is 8*s.* 3*d.*. The per-centage of Burton rates over those from other stations is 40¼. From Lincoln to London the rates for ale delivered is 11*s* 6*d.*, the amount deducted for cartage in London is 3*s.* 4*d.*, which is the total amount deducted for cartage. That reduced to station to station rates is 5*s.* 2*d.* The distance is 138 miles, the rate per mile is $\frac{7}{10}d.$ The charge for 100 miles is 5*s.* 8*d.* The per-centage of Burton rate over those from other stations is 95¾. The average per mile is 1*d.*, and for 100 miles 8*s.* 5*d.* Empties to Burton are charged at the same rate per ton as full. Empties to Norwich, Leeds, and Sheffield are charged 15*s.* a ton, collected and delivered. Empties are not returned to Lincoln, the ale being exported. The next is the London and North-western railway. From Kendal to London the station to station charge is 20*s.*, the distance is 252 miles, the rate per mile is $\frac{9}{10}d.$ The charge for 100 miles is 7*s.* 11*d.* The per-centage of Burton rates over those from other stations 46¼. The empties are charged at the same rate per ton as full. The next is the Great Eastern Railway. From Norwich to London (there would be a sea competition by this one) the charge is 10*s.*, the distance is 114 miles, the rate per mile is 1*d.*, the charge for 100 miles is 8*s.* 9*d.* The per-centage of Burton rates over those from other stations 32¼. From Lowestoft to London the charge is 9*s.*, the distance is 117 miles, the rates per mile $\frac{9}{10}d.$, the charge per 100 miles is 7*s.* 8*d.* The per-centage of Burton rates over those from other stations is 51. From Yarmouth to London the charge is 9*s.*, the distance is 121 miles, the rate per mile $\frac{9}{10}d.$, and the charge per 100 mile 7*s.* 5*d.* The average per mile is $\frac{9}{10}d.$, and for 100 miles 7*s.* 11*d.* Empties are carried free throughout the system. The rates for porter by the Great Eastern Railway from London to Halesworth is 8*s.*, the distance is 100 miles, the rate per mile is $\frac{9}{10}d.$, the charge for 100 miles 8*s.*, and the per-centage of Burton rates over those from other stations is 44¾. From London to Aldborough the charge is 7*s.* 6*d.*, the distance 98 miles, the rate per mile is $\frac{9}{10}d.$, the charge for 100 miles 7*s.* 8*d.*, and the per-centage of Burton rates over those from other stations is 51. From London to Beccles the charge is 8*s.*, the distance is 108 miles, the rate per mile is $\frac{9}{10}d.$, the charge for 100 miles is 7*s.* 5*d.*, and the per-centage of Burton rate over those from other stations is 56. From London to Norwich the charge is 8*s.*, the distance is 114, miles, the rate per mile is $\frac{8}{10}d.$, the charge for 100 miles is 7*s.*, and the per-centage of Burton rate over those from other stations is 65½. From London to Lowestoft the charge is 8*s.*, the distance is 117 miles, the rate per mile is $\frac{8}{10}d.$, the charge for 100 miles is 6*s.* 10*d.*, the per-centage of Burton rate over those from other stations is 69½. From London to Yarmouth the rate is 8*s.*, the distance is 121 miles, the rate per mile is 8*s.* 10*d.*, the charge for 100 miles is 6*s.* 9*d.*, and the per-centage of Burton rate over those from other stations is 76. The average per mile is $\frac{8}{10}d.$, per 100 miles is 7*s.* 3*d.* Empties are carried free throughout the system.

15,803. Have you not been comparing places which are at unequal distances from London?—Yes, they are at unequal distances; but I have been comparing the rate per mile.

"This comparative statement exhibits the fact that the trade of Burton is placed at a decided disadvantage in the cost of conveyance of its productions to the important port and market of London. While the rates charged to the brewers on other parts of the Midland system sending to London average but 1*d.* per ton per mile, by the London and North-western $\frac{9}{10}d.$ per mile, by the Great Eastern $\frac{9}{10}d.$, and porter from London only $\frac{8}{10}d.$ per mile, we are made to pay $1\frac{4}{10}d.$ Again, if we refer to the traffic which the Midland and London and North-western carry for us to stations upon the London and South-western, and London, Chatham, and Dover lines (see Section A.), we find they are content to receive upon a not inconsiderable portion 8-10ths and 1*d.* per mile as their charge as far as London; may it not be fairly asked how they can justify a higher rate per mile for conveyance to the London market? It is true in the latter case a terminal of 1*s.* 6*d.* is incurred, but 1*d.* per mile, or 10*s.* per ton, the proposed rate, would cover this; and the average of the two mileage charges we are comparing will, apart from the considerations of the immensely larger trade we do in London, which under the stimulus of a fairer tariff we should without doubt greatly increase. Our casks are handled with less difficulty than grain or heavy manufactured articles; they are easily moved by rolling; they are good loading. Every waggon which left Messrs. Bass & Co.'s yards in season ending 30th June 1865, carried an average weight of 2 tons 17 cwt., while the London waggons during the same period carried 3 tons 13 cwt. (the figures having been several times tested are accurate). They are of little or no risk to the railway companies, inasmuch as the claims for damage paid to the same firm by the companies during the whole of last year amounted to but 281*l.* 10*s.* 11*d.*, on a traffic paying over 100,000*l.* for carriage. No sheeting to protect them from the sun has hitherto been afforded, nor do the companies provide us with warehouse room free or at a nominal rent, as in the case of grain at Leeds,

Wakefield, Manchester, London, &c. Large rents are on the contrary paid by the brewers to the companies annually for the use of ale stores."

15,804. (*Capt. Galton.*) You have given the rate per mile between those various towns and London?—I have.

15,805. Can you give the gross sums paid between some of them?—Burton to London 14*s.* 2*d.*; Lincoln to London 11*s.* 6*d.* Of that 11*s.* 6*d.* we take 3*s.* 4*d.* for carting. The Lincoln rates include delivery at the docks, so that that reduces it to 8*s.* 2*d.*

15,806. Are there great breweries at Lincoln?—No, they are not very large; so that they pay from Lincoln to London 11*s.* 2*d.* It is 95¾ per cent. cheaper, or about half what we pay.

15,807. Is the Lincoln ale sold at the same price as yours?—It is export ale; it all goes to the docks. I have compared it with that price. They charge us the same whether our ale goes to the docks or not. The Great Eastern varies from 44 to 76 per cent. cheaper than ours. Norwich is 8*s.* per ton.

15,808. Has not Norwich got water competition?—It has, and it is a paying rate. It pays the Great Eastern because they have done it for many years. It is some charge above the cost of conveyance. It is a moderate one, allowing some limit for profit. We find that the highest rates are charged by the Great Northern, which is one of the best paying lines in the kingdom. The consequence is that we do not do much trade upon the Great Northern.

15,809. The rate from Lincoln to London is a Great Northern rate, is it not?—And Midland too. We represented this to Mr. Allport, and you will see how he treated us. I have brought the correspondence with me to show you how he treated us.

15,810. (*Chairman.*) Would not the effect of the proposal which you read just now be, that when you had re-arranged the rates in the manner you desire to do, you would compel the companies to re-arrange their local rates on traffic going beyond their own lines; that is, you would not allow them to make a reduced rate on through traffic?—I would reduce them according to distance. They are large railways that radiate from Burton, and they would fall into the lower scale while they are within the bounds of these railways. I have graduated them according to distance. I have given the authority of present practice upon certain lines for the chief of them. I say according to the present Scotch rates we should be safe for long distances.

15,811. You stated that they charged so much from Burton to London?—Yes.

15,812. You would charge so much beyond London in a southern direction?—Yes.

15,813. And when the North-western came to divide with the other railway companies the rate beyond London, they would get a smaller mileage than they got to London?—Yes.

15,814. If you re-arranged these rates, do I understand you to say that you would compel them to make exactly the same mileage rate to London as they would receive from the other company for goods going beyond London?—I think that to so important a place as London we have a right to infer that as it pays them in one case as far as London at 8-10ths of a penny, or a penny, per mile, it would pay them to carry our goods into London at the same rate.

15,815. You would abolish the distinction, in that case, between local rates and through rates?—I would in the case of London.

15,816. (*Capt. Galton.*) In taking the whole distance, I understand you to say you would charge 1½*d.* per mile for short distances, and 1*d.* per mile for long distances?—Yes.

15,817. Then, of course, from Burton to Normanton the charge might be 1½*d.* per mile on one class of goods, and 1*d.* per mile on another class, and you would still have the difference of the mileage rate between the same places?—Yes, but we should be satisfied if that scale were carried out, for no matter what you might choose to fix upon, it should be carried out equally in all cases. We merely adduce that in argument, as to our rates being higher than from any other station on the Midland Railway, to show that even in the case of goods going just beyond London they are satisfied with the lower amount, that is, with the rates to the London and South-western stations.

15,818. (*Chairman.*) That is, you ask that they shall not charge you a higher local rate than they receive as their fair proportion of the rate for the long distance?—Yes.

15,819. Will you proceed with your statement?—The next portion of the statement shows the inequalities in the rate of grain from different places to Burton-on-Trent. We are getting grain from Newport at 8*s.* 4*d.* per ton, which is a distance of 136 miles. It will be seen that the rate from Grimsby is nearly double that from Newport. The Great Northern District rates, are 40 per cent. still higher, and barley can be carried from France *viâ* Hamburg as cheaply as from the Great Eastern Railway; and, comparatively, much cheaper than from the Great Northern District. The rate from Hamburg to Grimsby by the vessel is from 6*s.* to 7*s.* per ton, and from Grimsby to Burton it is 11*s.* per ton. We have the Hamburg grain coming to Grimsby and West Hartlepool at from 6*s.* to 7*s.* per vessel, while the rate from Grimsby to Burton is 11*s.* per ton, which makes an average through rate of from 17*s.* 6*d.* to 18*s.* 2*d.* per ton. We have now a uniform rate from all the Great Eastern stations. It is a rate of 15*s.* 10*d.*, which has been in operation for three seasons. Prior to that arrangement we had a varied rate extending from 12*s.* 6*d.* to 20*s.*

15,820. (*Mr. Glyn.*) Is that a special rate between your firm and the Great Eastern?—No, other brewers have the same rate, 15*s.* 10*d.* is a generalization of the older rates. For the purpose of comparison I thought I was entitled to quote the old rates, of which the 15*s.* 10*d.* is a generalization. The Hamburg rate of 18*s.* 2*d.* is lower than some of the old rates from parts of Essex and Norfolk. We still consider we are paying 20*s.* We pay as much from certain districts per railway as we do from Hamburg or from France. We are getting a great deal from France *viâ* Newport. We have had 10 steamers this season, bringing barley to Newport. We expect to get it very much cheaper because they are developing a port there. The North-western are carrying at a very low rate. Although the Grimsby rate is nothing like so high as the Great Northern rates for grain, it still is 91 per cent. higher than the Newport rate.

15,821. (*Capt. Galton.*) Are they bringing it round by Shrewsbury and Stafford?—Yes, they bring it through Stafford.

15,822. You find water communication too slow for your trade, you say?—We do not use it; it is superseded altogether. On barley from Nantes in France to Gloucester the rate is from 11*s.* to 12*s.* per vessel; and the average through rate is 18*s.* 9*d.* per ton, while from Gloucester to Burton the rate station to station is 7*s.* 1*d.* We find we have better facilities for having it at Newport, because we avoid 1*s.* 9*d.* per ton dues and haulage for the water up to Gloucester.

15,823. The Midland Railway will not bring it to you equally cheap from Gloucester to Burton as the North-western do from Newport?—No, they bring it pretty cheap too. In fact, it is their cheapest rate, it is $\frac{6}{10}$ of a penny per mile. Of course Gloucester is a long distance. We pay 1*s.* 3*d.* per ton more from Newport than from Gloucester, but we avoid paying 1*s.* 9*d.* canal dues. In addition to that we get the grain carried from Newport at a computed weight of six quarters to the ton, or three to four cwt. over the actual weight; whereas the Midland charge the actual weight at the rate of 7*s.* 1*d.* We get a computed weight from Newport, so that we have the advantage of 6*d.* per ton rate, and 1*s.* 6*d.* in weight.

15,824. In fact you get a large discount?—Yes.

Mr. J. Cosgrove.

17 April 1866.

Gloucester is the only place I know from which we have barley carried at the actual weight. From all other places it is a computed weight of six quarters to the ton.

15,825. (*Mr. Glyn.*) The company finding the waggons ?—Yes.

15,826. Has it always been the custom of the trade to carry at a computed weight ?—For many years.

15,827. Why do the Midland depart from it ?—I do not know ; we have been in their hands entirely.

15,828. (*Sir R. Hill.*) Do those low rates depend upon the quantity carried at one time ?—No, they are satisfied if they have five ton lots, or wagon loads. It is unnecessary to say that to us, because we deliver them hundreds of tons at a time.

15,829. (*Chairman.*) If you succeed in establishing a uniformity of rates, you lose the advantage which you gain by obtaining this computed weight ? —No ; that being the custom it would be defined that six quarters should go to a ton universally.

15,830. You lose the advantage of having two railroads, one from Newport which carries six quarters, and from Gloucester which carries at the actual weight ?—Yes; the only alteration would be that the Midland to get the trade must now give us six quarters to the ton and reduce the rate.

15,831. Will you proceed with your statement ?—The traffic of the brewers with the railway companies at Burton is estimated to yield to the latter about 300,000*l.* per annum ; a sum so considerable, we submit, as to entitle the trade from which it springs to the highest consideration and support from the companies interested.

In conclusion, we beg to express a hope if, after due consideration of the working of the present system of management, it is found impracticable to carry out the provisions of the Act of 1844 in reference to railways, that the Legislature will secure, in the interests of trade and commerce and the public generally, the establishment of some wise and reasonable system of supervision of the administration of railways ; that a permanent Board of Commissioners shall be appointed to revise all rates from time to time, and that it shall form a summary jurisdiction to which busy men can appeal for correction and redress of all well-founded abuses and grievances.

15,832. (*Mr. Horsfall.*) You propose that that Board should regulate all the charges against the different railway companies ?—Yes ; and consider the circumstances of the trades of each district, and arrange the rates.

15,833. Would you have them regulate the rates, or only hear complaints where rates are considered to be too high ?—One or both, just as the wisdom of the Legislature determines.

15,834. And the same with regard to terminal charges ?—The terminal charges should be distinct ; they should be open and above board, and let us know what we are paying.

15,835. (*Mr. Glyn.*) Do you propose that it should be a Government Board ?—Not necessarily so ; some of the members might be selected from the present directors, but let them be approved of by the Crown and the Legislature.

15,836. (*Sir R. Hill.*) What did you say was the charge per ton for the conveyance of beer from Burton-on-Trent to London ?—14*s.* 2*d.* ; from that they are about to give us a drawback of 10*d.*, which would reduce it to 13*s.* 4*d.*

15,837. Before the construction of railways how was the beer conveyed from Burton-on-Trent to London ? —By canal; it was a comparatively small trade then.

15,838. Do you recollect what was the charge per ton by canal before the construction of railways ?—The average price, including tolls and other charges, was 13*s.* 7*d.* per ton.

15,839. Was that before the construction of railways? —No, that was in 1845. Bass & Co. continued to send ale by canal up to 1850. We could not send by railway for some years after our line, the Birmingham and Derby, opened in 1839. Mr. Gretton tells an amusing anecdote about that. He went to the railway company at Euston Square, London, and tried to see the board, intending to offer them the trade of Bass & Co. After waiting some time and being unable to see the directors, he was going away, until at last a clerk in the office said I will get you an audience. He then did get face to face with two of the directors. They declined, however, to negotiate with him, saying they were not prepared for such an addition to their business, as they had not sufficient wagon and engine power. Bass & Co. did not send ale by railway for some years, and not to London regularly until 1848.

15,840. Can you give the charge for conveyance of ale before the construction of railways ?—In the year 1838, the rate charged was 26*s.* per ton by canal (river to Gainsboro', and by coast to London).

15,841. Does that include everything ?—Yes.

15,842. The present charge by railway is 14*s.* 2*d.* per ton?—Yes, with a deduction of 10*d.* for drawback.

15,843. * * * * * *

15,844. The charge by canal before the construction of railways was 26*s.* per ton ?—Yes.

15,845. Then the reduction between Burton-on-Trent and London, since the construction of railways, has been nearly two to one ?—No, I should think not. I have not got it down as a matter of fact, but I can supply it. I hope you will quite understand that before we carried by railway, namely, in 1845, we did it for 13*s* 7*d.* per ton to London, which is less money than we can do it for now. We did that by our own boats. At that time the rate by railway was 25*s.* per ton, delivered to the same place,—City Basin.

15,846. (*Capt. Galton.*) Before railways were constructed, what access had you to other places besides London by canal ; had you access to Gloucester ?—We had access everywhere.

15,847. How did you get to Gloucester ?—By the Worcester canal ; we got in somewhere by Birmingham ; then the Trent navigation took us down to Gainsborough and Hull. In fact we used to send ale at one time from Burton to London by Hull. We used to go right away from the north of England by the coast. It was cheaper to send our ale down to Hull and round to London than it was to send it by the direct canal from Burton to London. We continued to send it by Hull after the line was opened. Of course I am quoting ancient history when I am speaking of ale having been sent round that way to London.

15,848. (*Chairman.*) Do you find any difficulty in getting explicit answers to the complaints you make to the Midland Railway Company with regard to the London rates ?—Yes, we do. On the 12th of January I wrote to Mr. Allport this letter with reference to the London rates :—

"ALE RATES to LONDON.

"Burton-on-Trent,

"DEAR SIR, January 12, 1866.

"REFERRING to our remark at the interview in your office on 22nd ult., that the rate from Burton to London was higher than that from other stations upon Midland Railway, and your answer that it was not so, we beg now to submit the following tabular statement, the facts of which have been gathered by personal inquiry at your offices at Sheffield, Leeds, Lincoln, and London, and also at the offices of the Great Northern Company in the country and in London.

—	Carted Rates.	Cartage deducted, collected, and delivered.	Cartage deducted, delivered only.	Reduced to S.S. Rates.	Distance.	Rate per Mile.	Charge for 100 Miles.	Per cent. cheaper than Burton.
	s. d.	*s. d.*	*s. d.*	*s. d.*		*d.*	*s. d.*	
Burton to London	—	—	—	14 2	122	1·4	11 7	—
Newark do.	17 6	4 2	—	13 4	120	1·3	11 1	4¼
Leeds do.	21 8	4 10	—	16 10	199	1·	8 6	36¼
Sheffield do.	17 6	4 2	—	13 4	171	0·9	7 10	47½
Lincoln do.	11 6	—	3 4	8 2	138	0·7	5 11	95½

In the case of Lincoln you have carted the ale to Messrs. Suart and Simpson, Clement's Inn, Lombard Street, for which service, to reduce the rate to station to station, we have deducted 3*s.* 4*d.*, the amount you charge us for carting much shorter distances. We have deducted a similar amount from the Leeds, you having recently agreed with the Great Western Company to make an allowance to the public of 3*s.* 4*d.* upon London carting they may perform on goods from stations like Leeds, where both companies are carriers. In the cases of Newark and Leeds, 2*s.* 8*d.* and 1*s.* 6*d.* are deducted, in accordance with the rate list, which gives the former as the London cartage, and the latter the country allowance. We trust we have only to call your attention to these glaring inequalities of charges to insure a proper adjustment of the Burton rate.

"Yours faithfully,

"BASS, RATCLIFF, AND GRETTON.

"James Allport, Esq.,

"General Manager Midland Railway Company, Derby."

In reply to that we received the following letter :—

"Midland Railway,

"General Manager's Office, Derby,

"DEAR SIRS, January 13, 1866.

"I AM in receipt of your letter of the 12th inst., in reference to the rates for your London ale traffic, which shall be at once inquired into.

"Yours faithfully,

"JAMES ALLPORT.

"Messrs. Bass, Ratcliff, & Gretton, Burton."

On March the 19th, not receiving any answer, we write this letter :—

"Burton-on-Trent.

"DEAR SIR, March 19, 1866.

"PLEASE oblige us with a further answer to our letter of the 12th January, referring to the subject of our London rate, and comparing it with those charged by you to the brewers of Leeds, Lincoln, Newark, and Sheffield.

"You acknowledged receipt on 13th January, promising the matter should be at once inquired into.

"Yours truly,

"BASS, RATCLIFF, AND GRETTON.

"James Allport, Esq., Derby."

In reply to that, on March the 20th, he writes to us regretting that our letter of the 13th of January has unfortunately been mislaid. We thereupon sent him another letter, and on the 31st of March we received the following letter from Mr. Allport :—

"Midland Railway,

"General Manager's Office, Derby,

"DEAR SIRS, March 31, 1866.

"IN reply to your letter of the 21st inst., I am very sorry your first letter in reference to the ale rates to London was mislaid by us. In the copy you have kindly furnished you allude to a conversation that took place as to the Burton rate to London being higher than from other places. My impression of this conversation, which is confirmed by others who were present, is that the remarks were more general, embracing the rates from Burton to different places, and not to London only.

"The instances you quote of rates said to be lower than those from Burton to London are of quite an exceptional character, the circumstances, as you will be aware, being altogether different, arising out of the coast competition.

"I am,

"Yours faithfully,

"JAMES ALLPORT.

"Messrs. Bass, Ratcliff, and Gretton."

In reply to that we write this letter on the 6th of April :—

"DEAR SIR, "Burton-on-Trent, April 6, 1866.

"YOUR answer of 31st ultimo, on the subject of the ale rates to London from the various stations upon your line, is hardly as satisfactory as we would wish.

"Are we to understand the remark 'coast competition' to apply to all the places named?

"Seeing that the rates we have pointed to have been in force some years, and it may safely be assumed are paying ones, may we ask upon what principle you charge us as much as 95¾ per cent. in excess of one of these places.

"We are quite at a loss to understand it; we know of no business in which (the lower charge being a paying one), prices so widely divergent can be charged.

"We shall feel obliged by a further answer.

Faithfully yours,

"BASS, RATCLIFF, AND GRETTON.

"James Allport, Esq.,

"Midland Railway, Derby.

This is their answer, dated April 7th, which is very characteristic of railway managers.

"Midland Railway,

"General Manager's Office, Derby,

"DEAR SIRS, April 7, 1866.

"IN reply to your letter of yesterday's date,—

"The matter referred to has been very fully considered, and as I have again and again expressed my views respecting it at the various interviews I have had with members of your firm, I do not see that I can add anything more to what has already been stated, and really do not think that any good can possibly result from a continuance of the discussion by correspondence.

"Yours faithfully,

"Messrs. Bass & Co., JAMES ALLPORT.

"Burton-on-Trent."

We answered that letter on April 13th as follows :—

"LONDON RATES.

"DEAR SIR, "Burton-on-Trent, April 13, 1866.

"WE beg to express our surprise at your answer of 7th inst. So far from the matter having been fully considered and gone into again and again, as you state, we would remind you that you have not once yet met the figures quoted in our letter of 12th January, you simply acknowledged receipt of that communication, promising to look into the matter and write us further. We heard no more of it until the middle of last month, when Mr. Bass said he had a few days previously met you, and you had told him our statement of the rates was altogether wrong. Accordingly we wrote you on 19th March, asking for an answer to ours of 12th of January; you replied you had mislaid that letter. We sent you a copy on 21st March, you answered 31st ult. that the rates arose out of 'coast competition,' you do not deny, as previously, their correctness. On 6th inst., feeling this general kind of answer to be anything but satisfactory, we asked you if it was meant to apply to all the places named, and upon what principle you charge us as much as 95¾ per cent. in excess of one of them, remarking we knew of no business in which the lower charge being a paying one, prices so widely different could be charged. In your answer of 7th April we regret to observe that you avoid meeting the question by saying the matter has already been fully considered, &c. The only conclusion we can arrive at is, that there is little or nothing to be said in defence of such exceedingly unequal charges.

"We are, dear Sir, yours faithfully,

"BASS, RATCLIFF, AND GRETTON,

"James Allport, Esq., Derby." Per W. W.

15,849. (*Capt. Galton.*) What remedy do you propose?—If they will not answer us, we have no remedy under the present irresponsible system.

The witness withdrew.

Adjourned till Thursday next at 12 o'clock.

Friday, 20th April 1866.

PRESENT:

THE RIGHT HON. LORD BELMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
SIR ROWLAND HILL, K.C.B., F.R.S.
T. B. HORSFALL, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
E. T. HAMILTON, ESQ., M.P.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

Capt. M. Huish.

20 April 1866.

Captain MARK HUISH examined.

15,850. (*Chairman.*) You were for many years general manager of the London and North-western Railway Company?—Yes, for about 18 years.

15,851. Will you be good enough to favour the Commissioners with your opinion with respect to the question of competition as affecting railways?—To do that I must revert for one moment to the establishment of railways many years ago. When railways were first instituted in this country, or at any rate before any large development of them took place, it was a question with the country and with Parliament whether the system should take the continental form, that of being managed by a paternal government, or whether it should run in the direction of free trade, which is more in accordance with the genius of the English people. Parliament in its wisdom, and I think very properly, discarded the idea of Government control, but it endeavoured to strike out, not quite an alternative course, but something between the two, giving a certain amount of protection to the public, and thereby enabling Parliament to put very heavy restrictions upon railway companies. In process of time the young giant broke through all these trammels, and asserted its right and power, in accordance with the genius of the English people, to something like free trade. The consequence of that has been necessarily that competition has sprung up in every direction among railway companies, and it has recently been encouraged by the Legislature. Parliament has for a long time past scouted the plea of railway companies who appeared before them pleading immunity from competition, or being allowed to oppose new lines on the plea of competition. Therefore competition is now the rule, and I think, if we may judge by facts, it has been very salutary for the public, and in the long run will not be prejudicial to the railway companies.

15,852. To what extent do you consider competition really and substantially exists now?—Competition has very largely increased by the extension and operation of what are called running powers, which running powers have been freely accorded by one company to another, reverting very much indeed, as I may say, to the first principles upon which railways were established. I allude to the theory of a railway being a great public highway which was open to everybody that paid the toll; a great number of companies have also been compelled by Parliament to admit the running powers as a lesser evil to themselves than the alternative of another line to carry the traffic. The consequence has been that running powers are extended in every direction, rendering it, therefore, in many cases unnecessary to duplicate lines, it being very much better for the existing companies, as they have found out at last, to take half a loaf instead of no bread, and to admit a company which pointed in a particular direction, and which has been hitherto a sort of preserve on to their line and take a toll rather than run the risk of a competing line being made. All railway companies have found out the wisdom of doing that, and then of course the result has been that running powers have been extended in every direction. In my opinion they cannot be too largely encouraged by the companies themselves and by the Houses of Parliament. Of course it involves another question, which I may touch upon hereafter, the safety of the matter; but under proper regulations I believe that all railway companies may freely run over each other's lines, and whether single or double makes very little difference.

15,853. (*Lord Stanley.*) You do not seem to entertain the fear which is sometimes expressed of allowing running powers over a single line?—Not the slightest. I have had on several occasions, having been appointed by the Board of Trade for that purpose, to arbitrate between railway companies in direct antagonism to each other, and perhaps not the less so from being across the water, and I have given them rules and regulations for their guidance where single lines only have been involved, where the freest running powers have been granted by Parliament, and where they have been and are now exercised in direct hostility, but I believe with perfect safety to the public. I look upon it that a single line under proper regulations is quite as safe as a double line.

15,854. (*Mr. Hamilton.*) Where running powers are granted, do you not think it is desirable that there should be the graatest punctuality in the departure and arrival of trains?—I fear that if I looked to punctuality in the railway system as an essential element of safety I should deprecate running powers, but I do not, for I believe that under proper regulations punctuality is a secondary consideration as to safety.

15,855. (*Capt. Galton.*) That is to say, you would see no objection to a line being, in point of safety, owned by one set of people, and being run over by several other sets of people?—By several other companies; but the Commission will permit me, probably, to explain how the safety is produced, and why I think the public would be as safe with three or four companies as with one. I do not say that the punctuality will be equal on a single line, necessarily the precautions required to work a single line involve a degree of delay which somebody must suffer from. But nothing could be more simple than the working of a single line, by a combination of the train staff and the electric telegraph. I am much interested in the telegraph myself, being deputy chairman of a telegraph company, and I always hesitated to recommend the working of a line by the telegraph alone; it involves a new class of dangers, but a class of a very serious kind, and I therefore believe that a combination of the electric telegraph and the train staff provides absolute immunity from accident, unless by a direct and intentional fault. The train staff is the simplest thing possible, and it is this, that no train can move on a single line without the possession of a particular staff, and as that cannot be in the possession of more than one person at a time no engine without it can move; of course it is to be delivered up at particular points of the line for convenience; it may be broken up into different lengths, so as to minimize the delay, and those lengths may be 4 miles or 40 miles, but still the safety is indubitable. Each company in possession of the staff for the time being is in possession of the line, and gives it up at a particular point, and hands it over to the next company that comes on, so that the line is blocked to every one but the one in possession of the staff; that, coupled with the electric telegraph in communicating the exact position of trains, provides, I think, every possible safety for the travelling public.

15,856. (*Chairman.*) Has that plan been generally adopted on single lines of railway?—I believe I was the first who adopted it on the London and North-western line many years ago, and it has been followed by a number of other companies. I rather think it is now recommended by the Board of Trade. I say that under regulations of that kind single lines

of railway are not only as safe, but they are theoretically safer than double lines. Within the last three or four months we have heard of accidents on double lines, of a train breaking down on one line and throwing a part of its train across another line when another train was passing, and that has happened in Scotland and on the London and North-western line within a few months past, and that class of accident cannot happen on a single line.

15,857. Do you know of any instance in which several other railway companies have power to work over a single line of railway besides the owners?—One instance occurs to me at the present moment, that on which I was arbitrator the other day between the Dublin and Meath and the Dublin and Drogheda Railway Companies, the one owning a line and the other running over a single line, and both of them competing for the same traffic. I am sorry to learn that they have cut themselves almost to pieces in the operation, but still on inquiry I learn that there is not the slightest difficulty or danger to the public.

15,858. (*Sir R. Hill.*) Is there not a difficulty in effecting repairs on a single line of railway?—Undoubtedly there is, if there is a heavy traffic; and I believe that the engineers will tell you that a single line is rather more difficult to keep in repair than a double line from the variety of the action, and is more expensive; in fact I have heard the expense of a single line put nearly as high as that of a double line. But I should say in explanation of that, that I do not think that difficulty arises with regard to maintenance, because whenever the traffic becomes so large as to necessitate a considerable number of trains, you may be pretty sure that the line will be doubled.

15,859. In connexion with the question of danger, does not the difficulty of making repairs on a single line lead to danger?—I think not, because there might be certain intervals between the trains on a single line as on a double line, and during the night there is very little traffic generally on a single line, but if the traffic is so large as to require to be carried at night, the probability is that the line will be doubled.

15,860. How are the owners of a line remunerated when running powers are granted to others?—By arbitration tolls.

15,861. Not by the tolls stated in the Act of Parliament?—No, by arbitration tolls invariably, and I think it is a very fair way of deciding the matter.

15,862. (*Capt. Galton.*) You think that the tolls in the Act of Parliament would be too high?—The Act of Parliament tolls would be too high, in fact they would be almost a bar to the exercise of the running powers.

15,863. You mean that no company could have running powers over the line of another without having got from Parliament the power to have an arbitration with the company owning the line?—Not over long lengths. Short lengths are of very little moment. If a company owns 60 or 70 miles of railway, and there is a small portion of a rival line, of six or seven miles between them, they might on a long fare of that kind pay the maximum toll over the short length without hurting themselves, but to run for a long length over a rival line without arbitration tolls is impossible.

15,864. (*Sir R. Hill.*) The parliamentary tolls being too heavy?—Yes, the rates having been brought down by competition, the parliamentary tolls generally to be found in Acts of Parliament will be higher than the charges levied by railway companies, and therefore the rival company could not live on them.

15,865. (*Mr. Horsfall.*) Have not the Midland Company and the London and North-western Company running powers over each other's lines?—Yes, the Great Northern, and the Manchester, Sheffield, and Lincolnshire, the North-western, and the Great Western Company have very freely exchanged running powers, most of them having been freely accorded without being made compulsory.

15,866. (*Capt. Galton.*) Do you think that it is fair upon a railway company that a rival company should be allowed to run over its line, and carry competing traffic at a rate to be fixed by arbitration?—Abstractedly I should say no. If you had asked me the question 15 years ago, I should have said it was very unfair, but practically it has turned out to be the fairest thing for all parties. If you will not allow a company to use and utilize your line by the payment of a portion of the toll, it is only fair I think to give them a competing line alongside of you, and therefore as the lesser of two evils, a company will almost invariably take the running powers with a reduced toll. Arbitration will take care that these tolls are not so unfairly reduced as to enable the non-owner of the line unfairly to compete with the possessor.

15,867. (*Sir R. Hill.*) I suppose that when running powers are granted, provision is made for the use of the watering places and stations?—Yes, but for that the running powers would be futile.

15,868. (*Mr. Hamilton.*) Are you of opinion that, in the case of heavy traffic, these running powers might be given without causing interruption to the traffic over the line of the owning company?—The general rule I think which arbitrators lay down, or at all events in the arbitrations with which I have been connected and have seen, has been this, that when three or four companies use the same line, and each happens to fix, either accidentally or more probably by design, upon the same hour, the priority of choice rests with the owners of the line, but the owners of the line having fixed a time, it is laid down that they shall not change it without giving a certain number of days' notice. I do not think that, practically, any difficulties arise.

15,869. Take, for example, the first 50 miles out of London on the London and North-western line, would there in your opinion be no practical difficulty in allowing the use of that line to another company?—The first 50 miles out of London on the London and North-western line is very full of traffic indeed, so full that if another company were to come and show that there was fair ground for carrying another description of traffic, it would I think be a question with Parliament whether another line should not be granted, and the time, I think, is not very far distant when there will be passenger lines and goods lines totally distinct.

15,870. (*Mr. Horsfall.*) Before the Hitchin line was opened did not the Midland Company run over the London and North-western line between Rugby and London?—No, they delivered the traffic to the London and North-western Company at Rugby, when they went to Hitchin they ran over the Great Northern line; but the traffic there is now so great that they are making a new line to carry it.

15,871. (*Mr. Hamilton.*) Would it be fair to say that the making of the new line by the Midland Company into London has arisen from the practical inconveniences that were found to exist in working the traffic over the Great Northern line?—I believe not. I believe that the amount of toll which they pay to the Great Northern is at least 100,000*l.* a year. I have heard that stated, and the amount of traffic which they turn over to the London and North-western Company at Rugby is so large that together it represents considerably more than the cost of the new line into London, which will cost nearly 3,000,000*l.*, and therefore it is their interest to make it.

15,872. (*Sir R. Hill.*) And probably to the interest of the public that it should be made?—There is no doubt that the traffic is now very well carried, but if it increases, as it has done already, I dare say the line into London of the Midland Company will pay, and if it pays the proprietors, it is not bad evidence, I think, that it is good for the public.

15,873. (*Mr. Hamilton.*) There is one remarkable instance of two companies using the same line where the traffic is very large; I mean between London and Redhill?—Yes.

15,874. And that is done without any practical diminution of the security to the public?—We saw

Capt. M. Huish.

20 April 1866.

the other day an instance of 149,000 persons being carried to and from Brighton in one day. These spasmodic efforts are sometimes made, but as a matter of ordinary traffic I think the line from London to Redhill is getting too crowded.

15,875. (*Sir R. Hill.*) Part of that line is trebled, is it not?—I believe it is quadrupled.

15,876. (*Chairman.*) Are running powers more frequently exercised now by mutual agreement than by actual authority under Acts of Parliament?—Yes.

15,877. With respect to the advantages which the public has derived from competition, do you think that the result has been that the public have had the advantage of much lower tolls than they would otherwise have had?—They have had lower rates. We used to contend, and we tried for a very long time, for a number of years, to convince ourselves that we were right, that where combination was possible, competition was impossible; and as long as the country was sparsely provided with railways, perhaps two only that would compete through a certain district, that theory held good; but the system has extended so largely that combination has almost ceased to be possible, and therefore competition follows as a matter of course, and competition necessarily brings down prices.

15,878. (*Capt. Galton.*) What is there to prevent a combination between the Great Western Company and the North-western Company between South Staffordshire and London?—Nothing, except that the Midland comes in for a share, and the Great Northern Company pushes itself very near to that district. It is the circuitous lines always that rule the destinies of the trade, and not the direct lines, which are supposed to be the legitimate possessors of the traffic.

15,879. (*Mr. Horsfall.*) Have not those companies equalized the rates?—There are now three, if not four railway companies between London, Manchester, and Liverpool, and two canals, and continual efforts are being made to keep the rates something equal; but the lowest rate must regulate all the others, and therefore there are periodical meetings between the railway companies to endeavour to maintain a standard of rates; that standard is broken through I believe every day or every week, but still they are always attempting to patch them up. Whenever a new railway company for the same traffic enters into the field, the first operation is to pull down the rates in order to establish a position, or to be admitted into the fraternity, and those rates never somehow get back to their normal condition; therefore every railway that has been opened between London, Manchester, and Liverpool has produced a lower standard of charges to the public.

15,880. How do you account for this, that when the rates have been once lowered by competition, after an agreement between the companies they do not go back to the old standard?—They do creep up a little way, but the company that comes in last to relieve the public, as they say, from the hardship imposed by the monopolists as they call them, until they become one of them themselves, are always afraid to go back quite to the same standard, lest it should be said by the public, "We supported you while you "pulled down the rates, but you have no sooner "come in than you are just as bad as the rest." And the reaction against that new company is sometimes so serious, that they generally endeavour to keep the rates down lower than they were before, just to entitle them to say to the public, "We have done you "some good."

15,881. (*Sir R. Hill.*) Is not a new company frequently placed under restrictions by Parliament as to these rates?—They are always placed under restrictions as to their tolls; they are compelled to take the lowest they are charging, but the tolls do not regulate the fares.

15,882. But the fares are frequently stated in Acts of Parliament now, are they not?—Yes, the fares and charges, you are quite right in that, and in some instances where competition has been carried on, Parliament has attempted to fix the existing rates that were charged when the bill was before the House.

15,883. That may account perhaps for the permanent reduction of the rates to some extent?—Yes.

15,884. (*Chairman.*) As a general rule railway companies do not exercise their full powers, and charge their maximum fares and tolls?—No; throughout the kingdom you will find that the rates are very considerably under the parliamentary tolls.

15,885. (*Sir R. Hill.*) When you speak of the advantages to the public of competition, are you speaking of competition between line and line, or that mitigated competition which arises from granting running powers?—I mean competition between line and line, where there are three or four lines going into one district. Take, for instance, the London and North-western, that is a direct line to Liverpool, and that is the legitimate line for carrying the traffic. The Great Northern line and the Sheffield combined form another and very circuitous line, and a circuitous line must of course reduce its rates so as to be equal to the direct line, or they would get nothing. But a third line may enter still more circuitous, and the greater the circuit made the greater is the danger to the existing companies, because of the rates being pulled down, and what I may call the illegitimate company generally gets a subsidy, and has to be bought off, in order that the traffic may be left alone.

15,886. (*Chairman.*) In what way does that company obtain a subsidy, do you mean an actual payment in money?—Yes, out of the traffic of course; for instance, they would say here is 100,000*l.* a year between those two points; we are 100 miles from a place, and you are 150; you can pull that 100,000*l.* to pieces, although you cannot do yourself much good, and therefore you shall have 25,000*l.* in order to let the other 75,000*l.* alone.

15,887. Are agreements of that kind frequently made?—Yes.

15,888. (*Sir R. Hill.*) Then of course the competition ceases?—The competition ceases at that point.

15,889. (*Capt. Galton.*) But this competition you say has led to a reduction of rates between important districts. Has it equally tended to reduce the rates to intermediate towns on the line where no competition exists?—No.

15,890. (*Sir R. Hill.*) The effect of competition is necessarily limited?—Certainly.

15,891. That is to say, the competition between lines of railway?—Yes.

15,892. But competition arising upon the same line, that is, on one which has granted running powers, would apply to every town on that line, would it not?—Not quite, because Parliament and the companies themselves, in following the indications of Parliament, always reserve to themselves what is called the local traffic. When running powers are granted, it is for the traffic which is the subject of competition with towns A. and B. The possessors of the line are not subject to competition under the running powers on their purely local traffic.

15,893. Is that invariably the case?—I think so.

15,894. Then that restriction imposed by Parliament deprives the local traffic of all the advantage of competition?—Not quite; it leaves it where it was; it does not deprive it of anything.

15,895. But it withholds from it the advantage of competition, whatever that may be?—Yes.

15,986. (*Mr. Horsfall.*) Does it not give the company which has its running powers leave to land their passengers at the intermediate stations?—That you may do by payment of the parliamentary tolls; anybody may do that, but that is not done by arbitration tolls.

15,897. (*Chairman.*) Do you think it would be advisable that Parliament should establish any general restrictions as to running powers?—To answer that question I should have to say something about increased precautionary measures as to safety. At the present

time the theory is, that every company may run over the line of every other company. Railways are all instituted as certain high roads, and like the canals, with the absence of facilities for the use of stations and watering places, and the parliamentary maximum tolls are a bar to the exercise of these powers which every company now possesses. To carry out, therefore, the idea shadowed forth by your Grace, it would be necessary to reduce the parliamentary tolls, which would be, I think, a very strong measure. I think that every case must be judged of by its own circumstances. Whenever, by arbitration, certain rates are giveu to one company to use the line and stations of another, a large number of questions has to be solved. Payment has to be made for every particular item, and all that is the subject of minute investigation, and of decision in every individual case. No general rules could be made to apply to those special circumstances.

15,898. Would it be fair when a small new line is constructed, that that line should have the privilege of obtaining running powers over its neighbour?—It is very difficult to answer an abstract question of that kind, unless the particular point and the circumstances connected with it were placed before me. Each case must be judged of by itself. I can well understand that speculators, seeing a profitable undertaking, might say, we will make four lines in at one end, and four lines out at the other, and ask for running powers over it in a length of 200 miles for the arbitration tolls; that, I think, would be stretching a principle which is sound in itself to an extent that I should be sorry to carry it; it would be unfair, and it would let in a host of small speculators to feed upon the property of the existing companies.

15,899. (*Mr. Hamilton.*) Who is to say where the privilege is to begin and where it is to end?—I know of nobody but Parliament or the assent of the companies themselves. The assent of the companies themselves is more generally given now than it was before, because a company, seeing a projected line that is to damage it, says, if we do not give running powers over this part of our line Parliament will give them a line into that town, and they concede them. If they do not, of course the belligerent comes to Parliament, and Parliament says it is better for you, the company, that you should run over that part of the other company's line rather than make a new line for yourselves. The principle, although sound, is not of such universal application as to be regarded as a very rigid law.

15,900. That is to say, it is a compromise between equals?—Yes; and the whole system is a compromise between the public and the railway companies, and between the two railway companies themselves.

15,901. (*Sir R. Hill.*) It is, to a certain extent, going back to the original theory of railways, is it not?—Yes, there is no doubt of that.

15,902. That every one should have a right to use the line who paid the toll?—Yes.

15,903. (*Mr. Hamilton.*) Did that theory assume that the company owning the line should also be the running company as well as the toll-taking company?—The original Acts of Parliament were framed very much upon the basis of Canal Acts, which were all Parliament had at that time to guide them, and a railway company was very much a toll-taking company, but they had certain powers to provide engines. I question whether it was always considered in the first instance that they would do so, but from the time of the establishment of the London and North-western line, giving a connexion with Birmingham, Parliament very soon saw that the original theory must be modified in practice.

15,904. (*Chairman.*) On the subject of amalgamation, do you think that amalgamation has been carried as far as, for the benefit of the public, it can be?—My answer is, that I cannot, in my experience, which has been of many years, although I have left the railway service for several years, point to an instance in which amalgamation has taken place in which it has not effected great benefit for the public and for the companies amalgamated. I do not think there is an instance on record where the public has been damaged or the companies injured by amalgamation.

15,905. What are the benefits which, in your opinion, the public derive from amalgamation?—Harmony of action, economy of working, certainty of regulation, and facility of transit.

15,906. (*Capt. Galton.*) Would it be advantageous to the public that some of the large lines should now be still further amalgamated, such as the London and North-western, the Midland, and the Manchester, Sheffield, and Lincolnshire?—Whether parallel lines should be amalgamated is a very grave question; but I have no doubt that all continuous lines—for instance, if you ran from London to John o'Groat's house—would be better on one hand; but whether parallel lines should be amalgamated is a question which I think is open to serious discussion. Companies may be so large as to be unwieldly; when I left the London and North-western Company we had 900 miles of railway, and I thought that that was a very large thing to have the charge of, but it was a mere baby to what it is now, and what it will grow to I cannot say.

15,907. (*Lord Stanley.*) Would you put it in this way, that it is not desirable that any one of the great companies should amalgamate with any other great company, but there is no objection to a certain number of the minor companies being absorbed either in them or amalgamating amongst themselves?—I think that the little branches, the feeders, or suckers, as it may be, should fall into the trunk lines, and the system would probably eventuate in four or five large complete systems, which would swallow up all the small independent branches; but whether you should carry it further and amalgamate such lines as the Midland and the North-western, or the Midland and the Great Northern, I am scarcely prepared to say.

15,908. (*Chairman.*) Do you know of any instances of parallel lines of railway being amalgamated on a large scale?—Parallel lines make arrangements, but Parliament, I think, has been rather jealous of amalgamating them. Whenever there are two parallel lines running parallel between two points, A. and B., after a struggle for the traffic, and as to their mutual power of injury, they are pretty sure to come to an agreement to divide the traffic.

15,909. (*Mr. Hamilton.*) Do you know of any instance in which a proposition has been made to Parliament to allow of the amalgamation of parallel lines?—Yes; the London and North-western Company tried to get hold of and to amalgamate practically with the Sheffield Company at one time, but the arrangement was given to the Great Northern, in order that competition might be kept up. The Lancashire and Yorkshire and the East Lancashire were, to a great extent, parallel, and they were permitted to amalgamate. They ran into each other's systems at many points, and the advantages were considered by Parliament to overweigh the disadvantages.

15,910. (*Mr. Horsfall.*) Are you aware whether the rates have been advanced or have been lowered since that time?—I am not aware of that.

15,911. (*Mr. Hamilton.*) Is it not the fact that the jealousy of Parliament has been shown with reference to the amalgamation of any of the great systems, whether they are parallel or not?—No doubt it has; but at the same time Parliament has generally conceded amalgamations. The continuous line, commencing with London and going to Birmingham, was amalgamated to Liverpool with the Grand Junction line; that again was amalgamated with the Lancaster line to Carlisle.

15,912. It is a fact, is it not, that the public are very much opposed to bills for amalgamation, feeling it to be detrimental to their interests?—Yes; but I do not think that the public are very good judges of the matter.

15,913. (*Sir R. Hill.*) Has not experience shown that the evils which were anticipated have not arisen?—I cannot find any reason against amalgama-

Capt.M.Huish.
20 April 1866.

tion, except the overwhelming power that it seems to place in one hand. The public is much better served, and the large companies are much more amenable to public opinion and censure than the small ones. Small companies will venture to do many things that large companies dare not do.

15,914. (*Mr. Horsfall.*) You are not prepared to recommend the amalgamation of parallel lines ?—I have not thought of that question sufficiently, but I am rather startled at the idea.

15,915. (*Lord Stanley.*) You would not consider it an advantage to the public that three such lines as the North-western, the Great Western, and the Midland should all unite ?—I should not. I think at any rate that we are not quite ripe for it ; what may come hereafter I cannot tell.

15,916. Would you be inclined to put it in this way, that in the event of the whole railway system falling into the hands of two or three great companies, which could easily overbear all opposition from small ones, it would be necessary for the Government to have larger powers than they at present possess as a means of control ?—Then you must retrace all your steps, and go back to the paternal system of the continent, getting rid of the free trade system which railway companies have very rapidly worked out for themselves.

15,917. (*Mr. Horsfall.*) Do you see no advantage in the amalgamation of railways with canals ?—No; as a general rule I should say that the natural rivalry of canals and railways should be kept distinct.

15,918. (*Chairman.*) The company with which you were formerly connected does possess a considerable length of canal, does it not ?—No ; the North Staffordshire Company is the company which has the largest amount of canals; it is divided pretty nearly equally between canals and railways, and there it was the canal interest that started the railways in the district.

15,919. (*Mr. Hamilton.*) Is it not the the fact, that in some instances the amalgamations of railways with canals have saved the canal for the use of the public ?—I do not think so.

15,920. Are you not aware of any instances in which canals which have not been amalgamated with railways have fallen into such a state of disuse that they are now choked up with weeds ?—Yes. The Andover Canal is pretty nearly in that state, but with regard to the Grand Canal, I was talking to the manager of that canal only yesterday, in the train, I mean the Grand Junction Canal from Birmingham to London, and he says that they are able to hold their own against the railways. The rates have been reduced, but they still pay a small dividend.

15,921. And their traffic has increased, I believe ? —Yes, as it always does when the rates are reduced.

15,922. (*Sir R. Hill.*) Is not that canal guaranteed by the North-western Company ?—No ; nor is the Duke of Bridgewater's Canal, nor is the Liverpool and Birmingham Canal. I think that the only canals which the London and North-western Company have any connexion with are the Lancaster Canal and one at Birmingham.

15,923. (*Mr. Horsfall.*) The London and North-western Company have some agreement with the the trustees of the Bridgewater Canal, have they not? —I cannot tell.

15,924. (*Chairman.*) Many of the witnesses who have been examined before this Commission have considered it a matter of great importance that an uniform system of rates should be established on railways. Will you favour the Commission with your opinion upon that point ? Do you think that uniformity of rates is for the advantage of the public ?—Uniformity of rates is destructive to competition. If you are to carry on railways upon the paternal system you may have equality of rates, or any regulations which the Government may lay down. But if you are to encourage (which has been the groove in which Parliament has run for many years) competition between railways, you must leave them freely to fight amongst themselves at any rates they can. An equality of rates necessitates the absence of competition, because railway companies would look to that rate with which it did the best on the longest line, and if all the outlying rates were to be regulated by that, there could be no competition with surrounding companies. The policy of the railway companies has been not so much a war of railways as a war of ports ; their policy has been to fight one port against another, and in doing that you must sink the distance of the railway ; for instance, if there is a manufacturing town in A. with a port at B. 60 miles off, and there is another port at C. 100 miles off, the policy of the railway companies is to equalize the rates to the two ports, and to fight the ports against each other. If you say that there shall be an equality of rates, of course the 60 mile rate would shut out the port that was 100 miles off.

15,925. When you were connected with railways you probably heard many complaints made as to this question from the ports ?—I think that all the principal complaints came from Liverpool; it has always been a standing grievance with them; it was so in my time at Liverpool, and I do not think that it has lessened since that time. It was said that Liverpool was unfairly dealt with, because, for instance, from Manchester to Gloucester the rate was very little more than it was from Manchester to Liverpool, which was less than a third of the distance. The question was, not whether the Liverpool and Manchester rate was too high, but whether the Manchester and Gloucester rate was not a great deal too low ; the Liverpool people would have been quite content if they had been raised to the rate at the other ports, because that would have made them the cheapest port. Then again as to Hull, it was always considered, when the question was discussed as to whether the railways should ship from Hull or from Liverpool, that the Manchester Company would have a great advantage in shipping from Hull ; that they would get a longer run upon the railway.

15,926. (*Mr. Horsfall.*) I believe it is in evidence that the Liverpool people complained, not only that the rates to other ports were too low, but that the rates to their port were too high ?—I do not know what the rates at Liverpool are now at all.

15,927. You stated just now that you thought the complaint from Liverpool was not that the rates to and from that port were too high, but that the rates to and from other ports were too low ?—At any time I believe the Liverpool people would have been quite content if we had put up the rates to all the other ports, for then their rate would have been the lowest. It is not that the rate itself is too high for the traffic to bear, on being exported to Calcutta or to New York, but that Liverpool cannot get it against the cheaper ports.

15,928. Independently of that competition, your are not perhaps aware that it is in evidence that the Liverpool people complain that the rates in themselves are too high ?—That I am not aware of.

15,929. Have you any suggestions to make as to giving increased safety to the public ?—I have been going into a theory that I originally took up, but upon that I have been beaten by facts, viz., that free competition should not exist among railways. If there is to be competition the freer the better, and that necessitates of course some consideration of how the public safety is to be guaranteed against any carelessness or recklessness. With regard to the outcry made about the danger of railways, I think the daily facts are a sufficient answer; and it is a standing marvel to me, and always has been, that with 200,000 men engaged in manipulating railways, and carrying the millions and millions of people which they do, the accidents have been so few, rather than that they should have been so serious occasionally. But as you extend the power of utilizing each other's lines, the question of safety does arise, and I have been always in favour of greatly increasing the powers of the Board of Trade. I have never shrunk from that

Government control which was so much feared by some managers of railways. I believe that a department like the Board of Trade, uninfluenced by any possible partiality, with the experience it has acquired, is a very proper guardian of the public interests, and I think that it should have extended powers. I do not wish the Commission to suppose that I would give them legislative powers altogether, but I would give them the power of seeing that proper regulations were carried out. One source of danger to the public I think is this, that poor railway companies do not keep up their lines in a sufficiently good condition. The powers of the Board of Trade cease when they have examined and inspected a line; but I would keep them in perpetual operation, and I think that by some machinery, either by indictment at the quarter sessions, or applications before a certain number of magistrates, or to any other body, the public should be empowered to call into operation the powers of the Board of Trade for the inspection of existing railways. I have seen many railways opened, and I know the efforts that have been made to trim them up just for the inspection. But the moment the inspection is over, and the certificate is given, the Board of Trade has done with it, and the railway company may allow its line to lapse into very bad order, especially if it is in a state of pecuniary difficulty. I think that that is one kind of protection that the public ought to have.

15,930. (*Chairman.*) Is is not very bad policy on the part of a railway company to allow its line to get into bad order?—Yes; but poverty causes them sometimes to run things very fine.

15,931. (*Capt. Galton.*) You would, I presume, limit the interference of the Board of Trade to inspections of the line and the works?—Yes; at any time after the line is opened.

15,932. (*Sir R. Hill.*) You would have periodical inspections?—No; because I think that would lead to great unnecessary expense and interference. I think there should be some well-considered scheme for calling the powers of the Board of Trade into action, either, as I have said before, by an indictment at the sessions, or by applications to the magistrates, and the parties making that application should be compelled to pay the costs unless they established some fair grievance against a bridge, for instance, or against a road.

15,933. (*Capt. Galton.*) You would not give the Board of Trade power to lay down all the regulations for the working of railways?—That is another point upon which I will speak.

15,934. (*Chairman.*) Is it your opinion that on any considerable length of line in the country the permanent way is not kept in the state which the public safety requires?—I do not think so. All the companies that can afford it do it for their own protection; but I have known an instance in which the thing has been run very fine, and I think that there would be a certain amount of public safety ensured if the powers of the Board of Trade never ceased. Then again as to the regulations, there are 90 or 95 railway companies, and every one of them has a separate code of regulations of its own, and although, from the very necessity of the case, the principles have been so well sifted that the general features of all those regulations are based upon a similarity of principle, yet they differ in every code and in every clause. And where you encourage the running powers over various lines, you ought, in my opinion, to have a recognized code of railway regulations. The system has attained such a complete maturity that there will be no difficulty in coming to a code of universal application as easily as in having byelaws, which require the assent and confirmation of the Board of Trade. You have machinery that might provide these rules and regulations. The clearing house is composed of 90 or 95 companies; they should establish, out of the enormous mass of conflicting regulations that there are now, one uniform system, and have the *fiat* of the Board of Trade upon that system. You would have the same power of enforcing regulations that you now have of enforcing byelaws.

Capt. M. Huish. 20 April 1866.

15,935. (*Capt. Galton.*) Are there not in some cases special regulations required to meet special cases?—Every railway has certain specialities which do not apply to the general run, and these would be confirmed by the Board of Trade also, but I allude to salient points of difference; for instance, I have in my mind two lines of railway which connect with each other, and on one there are the white and the red and the green signals, while on the other line, which runs into it, the green signal has generally been abolished, which is the signal of caution, and altogether they have only two signals. Then again you find sometimes negative signals and positive signals, and if you are to encourage an engineman on the one line to run freely over the other, you ought not to confuse his mind with a fresh book of signals.

15,936. (*Mr. Hamilton.*) How would the negative and positive signals confuse his mind? The negative signal means that no signal is shown until danger arises, but the positive signal is dropped down when a train approaches a station?—The positive signal is generally shown at junctions, and the negative signal is shown on the main lines.

15,937. Do you consider that if the signals and mode of working had been, at the first opening of railways, required to be adopted by the Board of Trade, that the system of working would have been in so mature a state as it is now?—I do not think it would.

15,938. Do you not think that it may still improve beyond what it is now, and if you were to fetter the thing by diminishing the responsibility of the managers, and throwing it upon the officers of the Board of Trade, you would not prevent its further development and improvement?—I do not wish the Board of Trade to be the initiators of these things, but I wish them to confirm them and make them law, and when they are generally pronounced to be what they ought to be, they should be assented to by all railway companies.

15,939. Would you propose that a code of regulations should be drawn up at the clearing house, and that that code should then be approved by the Board of Trade?—Yes, and I would give them the sanction of law.

15,940. Would it not be difficult for the manager of a railway to make some special regulation for particular cases if he must appear first in the clearing house and then at the Board of Trade?—The clearing house I think would be a very convenient place at which to originate the first general code of rules to be applicable to all railways alike, and then I should say that all specialities should go direct from the companies to the Board of Trade. We have seen a striking instance of disagreement among the railway companies as to the signals between the drivers, passengers, and guards, which I believe is as far off a solution as it was 10 years ago when I had it in hand.

15,941. (*Mr. Horsfall.*) You think that there should be some uniform system of signals that should be applicable to all railways?—Yes; I think that the general rules and regulations should be unvarying.

15,942. (*Capt. Galton.*) Is that so necessary in the case of railways when the engines of one railway company do not run over the lines of other railway companies?—Yes, wherever running powers are granted.

15,943. The line upon which there is a diversity of signals is a very rare case; for instance, there is only one or two lines that have different signals from those in general use, and they I believe are the Great Western and the South-western?—The Great Western Company has the disc signal and the South-western Company has the semaphore signal. The South-western Company has also the electric semaphore, and you will find that there is upon every railway some dissimilarity, and if you encourage running powers, —and in my idea there would be more unrestricted

Capt. M. Huish.
20 April 1866.

competition than has yet been granted,—if you were to encourage the use of one line by the engines of another, you must simplify as far as possible the regulations, so that the minds of the engineman and guard shall not be confused by a diversity of rules or a diversity of signals.

15,944. (*Lord Stanley.*) Where would be the difficulty in establishing a single uniform code of signals, either by legislative authority, or, which would probably be better, by agreement between the companies, to be confirmed, if necessary, by legislative authority for the whole country?—I believe it would be perfectly facile; of course railway companies might startle a little at it, but I think they would at last fall into it, finding that it would be for their own individual advantage to do so.

15,945. (*Sir R. Hill.*) I understood you to say that under present arrangements, supposing running powers to have been granted, if an engine leaves its own line to go upon the line of another company, the driver has to obey the signals of that other company?—Certainly.

15,946. Therefore the engine driver in the course of his journey has to obey perhaps two or three different sets of signals?—Yes, with a different book in each pocket.

15,947. And the difficulty and danger which appear to present themselves to your mind arise from the circumstance, that the same individual has to obey upon one line one set of signals and upon another line another set of signals?—Certainly.

15,948. Bearing in mind the necessity, or the occasional necessity at least, for prompt action, there would be the risk, I suppose, of his forgetting at the moment upon which line he happened to be?—Undoubtedly.

15,949. (*Chairman.*) It has not been unusual, I believe, for the managers of railways to confer together upon matters affecting the general interests of railway companies?—That takes place continually.

15,950. Has such a proposal as you have hinted at been considered at such meetings?—The nearest approach to it has been repeated, but ineffectual attempts to come to some general agreement upon the subject of communication between the passengers and engineman, but which has up to this time failed. Several inventions have been brought before the Board of Trade, and I do not know whether they have yet been reported upon.

15,951. But the proposal you have referred to, of an uniform system of regulations, has never, to your knowledge, been considered?—I am not aware of it.

15,952. (*Mr. Hamilton.*) I think the answer you have given to this question is hardly the practical answer that we should desire, because it refers to a state of things which does not now exist. I understood you to say that in the event of running powers being granted to other companies a uniform code of signals would be very necessary; but we rather want an answer to this question, whether it is necessary under existing circumstances, and whether you can attribute the accidents which have occurred in any way to the dissimilarity of the signals on existing lines?—I do not think I can call to mind an accident that has arisen from that cause; but seeing the tendency of Parliament every session to give increased running powers, and the still greater tendency of railway companies among themselves to concede them, I think the time has arrived when a simple code of regulations applicable to all becomes essential, and not only essential, but in my opinion it would facilitate very much that which I think is desirable, namely, a still further extension of these running powers.

15,953. (*Capt. Galton.*) Is it not practically the case that there are no lines except the Great Western and the South-western which employ signals different from those on other lines?—No. The signals on the Midland and North-western lines do not quite agree. I think the green signal is still put up on the one line, and upon the other it was abolished some time ago.

15,954. (*Mr. Hamilton.*) With regard to the inspection of railways by the Board of Trade, I suppose you would not release railway companies from their present liability to make compensation for accidents?—Certainly not; but whether that compensation should be regulated or modified is another question. My recommendation does not involve the consideration of that question at all.

15,955. How would you propose to carry out the inspection by the Board of Trade in order to give any increased safety to the public without causing very considerable expense?—I will assume, for instance, that the public in a particular district find reasonable or unreasonable fault with the state of a very important bridge over a running stream, which they may have seen sinking in the foundations, or something that they think will produce danger. Bridges have given way, and then the company has been subject to claims for very great pecuniary compensation; but as prevention is better than cure, if any of these complaining parties were to go to the quarter sessions, or before the magistrates and indict the bridge, or show reasonable ground for taking action, I think the Board of Trade should have power to go and inspect the bridge, or work, or embankment, and to issue an order that certain repairs should be done.

15,956. That is a very obvious case; but take a case of this kind, where a very serious accident occurs, possibly from the line being at the time under repair at a particular point, what possible effect do you think the inspection would have in guarding against such an occurrence as that?—If you allude to the accident which occurred at Staplehurst, no power on earth can make men do their duty.

15,957. I was not alluding to that, but to the accident which occurred on the Great Western line at Rednall. It appeared that the line at the time was under repair, and the engine was allowed to pass at a greater speed than it ought to have passed at such a time?—That was a case of occasional repair, of an occasional defect. I think that the same state of things would possibly arise from the cause that caused the Rednall accident.

15,958. In those cases would not inspection fail to reach them?—I should be very sorry to lead the Commission to suppose that I think that anything I can suggest would prevent accidents; so long as there are 200,000 men employed upon railways, subject to the common failings of humanity, accidents will continue.

15,959. (*Capt. Galton.*) At the present time have not the Board of Trade the power of inspecting any line after it has been opened?—Not any compulsory power as to ordering I think.

15,960. No, they have no power of ordering anything; but you would, I think, give them the power of ordering special works to be done?—I may not have suggested the best mode of doing it, but I certainly think that some remedy ought to be provided for the present state of things.

15,961. You think that with their present powers the Board of Trade have not practically everything that is wanted. If the public in some particular district call upon the Board of Trade to inspect a line, and the Board of Trade inspect it and report that the line is in an unfit condition, would not the directors of that company, if an accident occurred, be liable to a very serious penalty if it could be shown that they had not taken any steps to remedy the defect?—No doubt a criminal indictment would lie, and they would also be liable to make compensation.

15,962. Have they not, therefore, every inducement to remedy any danger that is pointed out to them?—I do not think that the rule is sufficiently stringent.

15,963. (*Mr. Hamilton.*) Do you not think that the liability to inspection would in some measure have the effect of reducing the amount of compensation paid; in other words, if the system of inspection which you propose to introduce were established, do you not think that juries would take it into their

consideration, and give smaller damages in case of accidents ?—No. There is no doubt that juries are sometimes a little vindictive, but the judges keep them in the right ; the compensation is generally regulated by the evidence, and by the charge of the judge, and I do not think the jury would be much affected by it.

15,964. Will you favour the Commission with your opinion as to terminal charges ? Do you think that the state of matters as affecting those charges is at the present time satisfactory ?—The terminal charges are charges not quite defined, I believe, by Parliament.

15,965. Companies are allowed to make a reasonable charge for loading and unloading ?—Yes ; and that must be regulated by the circumstances of the case ; for instance, if a parcel of goods is given to a railway company to take from Watford to Woolwich, the terminal charge would be four times the railway charge, because it depends entirely upon the distance it is taken over the line. I do not know that you could lay down any abstract rule to regulate terminal charges.

15,966. What do you consider is included under the term "terminal charge ?"—A terminal charge includes the loading or unloading, invoicing and checking, and delivery.

15,967. Do you consider that the interest of money expended in sidings and in station accommodation is properly included ?—I am not aware that that has ever come directly under consideration. Delivery is the greatest charge, the handling, lighting, the stationery, porterage, clerking. and all those various items ; and of course the terminal charge bears a heavy ratio in exact proportion to the shortness of the distance that an article is carried over a line.

15,668. (*Mr. Horsfall.*) When you speak of delivery, do you mean delivery in carts and waggons after the goods have left the railway ?—Yes.

15,969. Is that generally understood to be included in the term ?—If you go to a railway station and ask what is the rate to any town, the rate given you would include the delivery at the merchant's door in that town.

15,970. That must vary considerably, according to the distance ?—It varies according to the rates of charge in the district, and according to the distance carried. Sometimes railway stations are on high levels, and goods have to be lowered or raised, and there are all these conflicting elements of charge which render it impossible to lay down a standard of rule.

15,971. (*Mr. Horsfall.*) What do you say as to goods where no service of that kind is rendered, for instance, coals ?—There is no terminal charge except a small wharfage charge on the coals for the use of the wharf ; that is generally about 2*d.* a ton. But goods require to be invoiced and checked, and there are a variety of duties, whether the owner takes them away in his own waggon or leaves you to do that duty for him.

15,972. Take, for example, the case of the Burton breweries, where the carriages run right into the establishment of the company, and no trouble or expense is incurred ?—I presume there is no terminal charge there.

15,973. (*Mr. Hamilton.*) I think, for the purpose of your evidence, it is necessary to limit the ordinary meaning of the expression "terminal charge" in this way, so as to exclude the cost of cartage ?—Perhaps so. The principal use, as regards the public, of the terminal is between the companies themselves, because I think you will find that by the operation of competition the charge made by the railway company, including this terminal, will not be, if so much, as it is by the parliamentary tolls ; but suppose there are three railway companies, one initiating the traffic, one delivering it, and one being intermediate, terminals are necessary to be allowed, otherwise the intermediate company would receive payment for a service that it never rendered. I will suppose three railway companies forming a single line between A. and B., the centre company would not receive any terminals, because the other two companies would be damnified if it did. But I think, practically, if you test any rate on a long line by the tolls in the Act of Parliament, you will find that the total rate, including terminals, comes to less than the amount of the toll that they would be entitled to charge.

15,974. (*Capt. Galton.*) But the towns where there is no competition are obliged to pay, not only the maximum railway charge, but whatever the railway company thinks reasonable in addition ?—Certainly ; but if you put up the rates very high the traffic will not go. The railway wants traffic, and must accommodate itself, when there is no competition, to such a rate as the merchant can afford to pay, or he will not send his goods. I know that it has been a very vexed question for many years as to terminals, and I have thought of the question, but I cannot see my way out of it as to the public.

15,975. (*Mr. Horsfall.*) Take the case between Manchester and Liverpool, and suppose that they all agree to make the same terminal charge, the goods will still be sent ?—Yes, but the question then would be, first, whether that charge applied against the tolls came to more than the tolls, and I think you would find that it did not. If it did, then the balance would be terminal in the strict sense of the word. If it was unreasonable, then I know of no way that you have of making it reasonable but by fresh competition.

15,976. You are aware perhaps that considerable dissatisfaction has been expressed with the clause that is now generally introduced into railway bills, allowing companies to make what they think proper to call a reasonable charge ?—Yes.

15,977. How would you propose to meet that dissatisfaction ?—I do not know how to do it, except by letting loose more competition.

15,978. Do you think that it might be met by fixing a maximum charge ?—A maximum terminal of general application would be a maximum injustice, either to the public or to the railway companies. It must vary according to the necessities of the different districts.

15,979. I should rather have said a scale of terminal charges ?—Then you would have a scale for cotton, another scale for sugar, and another scale for corn, and all those must vary according to the districts in which the staples are produced, and the cheapness of the terminal depends upon the bulk of goods of a particular kind that the railway company has to deal with. If you have an immense amount of cotton, the terminal ought to be cheaper than in the districts to which a bale only would occasionally go.

15,980. Do you think that that would be one of the cases in which the Board of Trade might legitimately interfere in the way you have suggested ?—Although willing to see the powers of the Board of Trade extended, I do not think I would call them in on commercial questions.

15,981. Supposing that the sender of the goods is dissatisfied with the charge made by the railway company, what is to be his remedy but in a court of law ?—He should try another railway to get to the same place, or a canal, and I think that the gradual operation of the fight between them would bring down his terminal charge to a reasonable rate.

15,982. But suppose a case where there was no canal to compete with the railway ?—Then of course he would be very much in the hands of the railway company.

15,983. (*Chairman.*) Do you see any objection to railway companies being called upon to publish the terminal charges at each of their stations ?—It would be very troublesome, and they would easily evade it. They publish their rates now, and all they would have to do then would be to cut it up into rate and terminal. They would get the same price out of the public, but they would take care to make the terminal so low then that they could not quarrel with it.

15,984. You stated that in most cases the total charge, including both the terminal and the mileage

Capt. M. Huish.

20 April 1866.

rate, was less than the maximum the companies were entitled to charge?—Yes, it was so.

15,985. Does that apply to short distances, say from 10 to 25 miles, or is not the charge in that case oftener larger than it would be possible to make it without terminals?—Yes, certainly; when you come to a short distance the terminal is proportionally overwhelming.

15,986. There is some considerable traffic that does not go more than 20 miles?—Then the terminal, in that case, would not fit in with my theory.

15,987. I believe it is said that on the North Staffordshire line there is a large amount of traffic that does not go more than a few miles?—Then the toll would possibly not make up the difference.

15,988. In such a case as that, would there be any hardship in asking railway companies to state distinctly what their terminal charges are?—There would be no harm in their telling what they were; but what is the remedy if they are too high? I do not see that.

15,989. One of the great complaints on the part of the traders is, that they do not know what the terminals are until the charge is made out?—They know that the charge from A. to B. is 10*s.* a ton for a certain class of goods; they do not know how it is made up, nor does it matter to them to know. In the long run the companies might be able to show, with regard to the toll coming to them upon short distances, that the terminals would overbear the toll, and I do not see the remedy for that.

15,990. (*Capt. Galton.*) A railway company can charge by Act of Parliament a reasonable sum for terminals, but if it was obliged to show what the terminal was it could, at the most, only charge its maximum rate, the parliamentary rate for the carriage of goods; and if the trader considered that the terminal in addition was unreasonable, he would then be able to go to a court of law—the county court, or some other court—to have the matter adjudicated upon?—I suppose that the common law now would give some court the power of saying what was "reasonable," and if that word is to be adjudicated upon, I know of no other way of getting at it.

15,991. (*Mr. Hamilton.*) Have you not now the means of obtaining sufficient evidence for some tribunal or other to interpret that word "reasonable," not as an uniform interpretation, but to allow each railway company to come before a tribunal and show what, with reference to their interests and the public, what would be a fair interpretation of that word "reasonable?"—The first question is, Is the company to be allowed any profit upon its terminal, a "reasonable profit?

15,992. Yes.—There is no great difficulty at any one particular station in finding out the cost of the terminus to the railway company; but the amount of profit to be included under the word "reasonable" I am not prepared to speak to.

15,993. The words are "reasonable charge," and they mean, I presume, reasonable remuneration for a service rendered?—Yes.

15,994. With the experience which is available now upon all the great railways, would there be any difficulty in arriving at a practical interpretation of that word "reasonable"?—The ordinary terminal allowed between railway companies is, I think, 2*s.* 6*d.* a ton, with no cartage, subject to various increases and diminutions according to the description of the goods carried.

15,995. Do you mean in London?—No, in the country. Out of the 2*s.* 6*d.* probably, in many cases, there might be 4*d.* a ton profit; and I do not know whether that would be considered a reasonable one or not, nor what tribunal would decide upon it.

15,996. (*Sir R. Hill.*) Might not the Act of Parliament say what additional per-centage should be charged for profit?—Yes, you might get at it in that way; say, 20 per cent. upon the cost price.

15,997. (*Mr. Hamilton.*) I think you stated that there was no difficulty in ascertaining the actual cost?—No. Take, for example, a station in the country; nothing is so easy as to know your total annual actual expense and the total tonnage.

15,998. If Parliament should say that to the actual cost a certain per-centage should be added for profit, would not the difficulty be overcome?—It might be mitigated at all events.

15,999. (*Mr. Horsfall.*) Might not the case be met by acting on the principle which has been suggested by some of the witnesses, that in case of a difficulty arising between the trader and the railway companies there should be an appeal to the Board of Trade to appoint an arbitrator, and that the decision of that arbitrator should be final?—That would be introducing a regulation with regard to commercial profits which is so new and startling to me, that I should be almost afraid to venture to give an affirmative to it.

16,000. Looking to the fact that the Legislature has already decided that the charge is to be a "reasonable" one, would not that be a legitimate course to pursue in order to ascertain whether a company was or was not making a reasonable charge?—I think that the companies, if driven to that, would rather go to a court of law than to the Board of Trade.

16,001. It might be convenient to a railway company with a large purse to do so, but how would it be for a small trader?—The county court, I believe, is not very expensive, and the charges are generally considerably under the amount that would come within the jurisdiction of a county court.

16,002. But then the company could appeal from that decision?—Yes, no doubt they could.

16,003. (*Chairman.*) A recognized scale of terminals is now in use at the clearing house?—Yes, between the railway companies themselves for the facility of the division of their own traffic.

16,004. Is that scale founded upon what the expenses are really supposed to be at the terminals?—It was jumped at very much in the first instance. I think if you were to ask a dozen railway managers, they would not be able to tell you how it was arrived at. There was, perhaps, a floating idea in the minds of those who constructed those rates that the rent of the station should be partly included, because the intermediate company (and I am now supposing three companies to be concerned) is entitled to nothing but its mileage, while the two terminal companies have station expenses to provide for in addition. The rates fixed in the clearing house were merely so fixed as a convenient mode of dividing the traffic between themselves; they were not fixed with reference to the public at all.

16,005. Have there ever been changes made in the scale of terminal charges which have been recognized by the clearing house?—Not in my time.

16,006. As between the companies, I presume they may be considered as having given satisfaction?—I think they have.

16,007. Does not that probably lead to the conclusion that they are not very far out, and that they may be fair charges as between the companies?—I think so; and if the public should be charged more than the companies divide amongst themselves there might be a reasonable grievance.

16,008. (*Sir R. Hill.*) Does not that furnish a means of stating what the terminal charges are?—Yes, it is an approximate estimate.

16,009. (*Mr. Horsfall.*) What objection is there to giving publicity to these terminal charges?—I think that there are but two terminal charges, one for London, and one for all county stations in England.

16,010. (*Chairman.*) For different descriptions of goods are there not very different terminal charges?—Yes.

16,011. Your attention has been directed, I believe, to Irish railways?—Yes.

16,012. Will you be good enough to state what circumstances have called your attention particularly to them?—I have been called in by several of the Irish railway companies to settle differences between them; and I have been sent over to Ireland four or

five times by the Board of Trade to act under the clauses in certain Acts of Parliament, giving the Board of Trade a right to appoint an arbitrator, and that has brought me in contact with most of the Irish railways, I have been more thrown into contact with the Irish railways during the last five or six years than with the English railways.

16,013. Will you be kind enough to state the opinions you have formed as to the Irish railways ?—I think that any one who travels much on Irish railways must be struck by four facts: that the rates are very high, the speed is very low, the trains are very few, and the remuneration to the proprietors is very small. These four facts of course set one thinking what could be the cause, or what is the remedy. I find that there are some 56 railway companies in Ireland, governed by 461 directors, with, I think, upwards of 50 managers, 50 secretaries, 50 locomotive superintendents, and 50 of every other description of officer.

16,014. Although there is that number of railways, are not a very considerable number of the small ones worked by the larger ones ?—Not very many of them.

16,015. Do you think that there are more than about 20 separate independent working companies ?—From Dublin to Londonderry there are a considerable number, and also in the south and south-east of Ireland. I was at Cork a few weeks ago arbitrating between two railway companies, and there are four railway companies there, which you might comparatively put into this room, and the lines are all worked independently. The total weekly receipts upon all the Irish railways together, which are governed by 461 directors, are only equivalent to the receipts for two days and a half on one single railway in England; the consequence is, that the system is over-governed; the country is not a commercial one; it is thickly peopled in parts; but the people are very poor; it is an agricultural country; there are no great centres of manufactures or commerce; and the consequence is, that they are not able to afford to keep up the very extended and expensive system which is now in force. If you look to the map of Ireland, you will see that you might deal with it in a very different way from England. England is so gridironed over with railways; there is such an interlaced system, and they so overlap one another, that it is almost impossible to throw the country into districts. Ireland, on the other hand, is in a different state altogether, and nothing would be more easy than for a commission, consisting of, say, three competent railway men, with large railway experience, to throw the entire of the Irish systems into four groups, the northern, the central, the southern, and the south-eastern, and they would form four very convenient groups, very much smaller than many of the railways in England, and by that means you would get rid of a very expensive management, and of the numerous changes of trains and companies; you would facilitate the transit of the traffic; you would enable them to charge lower fares; you would be able to give more trains, and to produce a very much better result to the proprietors. These are the views which I have very strongly felt indeed from my numerous visits to Ireland. I do not see any insuperable difficulty in throwing the whole of the railway system of Ireland into four groups. There are certain points where they do overlap one another, and where you would have to adjudicate between interests; nor would it be a very difficult thing, throwing them into those four groups which I have suggested, to decide the relative value that each individual member should bear to the others, and fuse them, by amalgamation, into four systems; you would then get rid of the inconvenience which every one must have felt in travelling, in changing from system to system; for instance, in going from Dublin to Belfast, you have to change, I think, from three or four different companies; and I wonder what the English public would think if they had to travel over the lines of four different companies between London and Birmingham. In some instances they do not send the carriages through.

16,016. (*Sir R. Hill.*) But you can book through, can you not ?—Yes, you can from Dublin to Belfast.

16,017. (*Chairman.*) Have you any scheme to recommend by which such an amalgamation as you speak of could be effected ?—It would be very difficult to bring about, for you would have the vested interests of all these Irish directors to conflict with, who would probably be opposed to the scheme, and you would have the Irish proprietors also to deal with.

16,018. (*Lord Stanley.*) As I understand you, there are about four men employed to do the work of one ?—Yes, and there are four engines employed.

16,019. If there were four Commissions, which would displace the directors on the permanent staff, the directors would, I suppose, look upon it as being so much taken out of their own pockets ?—Yes, I think it is very likely they would.

16,020. (*Sir R. Hill.*) There is nothing to prevent voluntary amalgamation in Ireland, I suppose ?—No. The proprietors of the Dublin and Drogheda, the Belfast Junction, the Irish North-western, and the Ulster lines, and there are two other smaller lines that run into them, have meeting after meeting brought forward the question of amalgamation, but the directors, as I understand, have always put it aside.

16,021. Can you account for the fact of voluntary combination or amalgamation taking place in this country, and for the absence of combination or amalgamation in Ireland ?—I cannot. I have been surprised at it. I have asked them the question over and over again, and every one has said, we are ready to do it. But nevertheless nobody comes forward to do it, and it is not done.

16,022. Would there not be the same advantages in Ireland as in England from amalgamation ?—Much greater advantages.

16,023. There are the same facilities, I suppose, in Ireland as in England ?—Much greater facilities.

16,024. (*Lord Stanley.*) Is it not the fact that public opinion in Ireland is not strong enough to overbear private interests ?—Yes.

16,025. In England, on the other hand, the private interests of directors on the railway staffs are not allowed to stand in the way of amalgamations ?—That may be. You would find that the proprietors of the Irish railways would be cordial in favour of very extended amalgamation in their country; and I am sure that all the four evils I have glanced at would be greatly modified, if not removed, by such a step.

16,026. (*Mr. Hamilton.*) Surely it is in the hands of the proprietors themselves, if they are convinced of the expediency and advisability of amalgamation, to carry it out ?—Theoretically they can do so certainly.

16,027. (*Sir R. Hill.*) Although they have not, in fact, done it ?—No.

16,028. (*Chairman.*) Do you think it would be desirable for the Legislature to interfere in any way ?—I think that if this Commission or the Legislature recommended something of the kind, they might couple it with some boon. If it were carried out according to what I know is a very fond theory in Ireland, giving legislative assistance as to debentures at low rates, and things of that kind from the public Exchequer, the Government would be perfectly safe with their money, and it might facilitate an arrangement of the kind.

16,029. (*Sir R. Hill.*) You are aware probably that that has already been done to a considerable extent ?—The Baronies have been called upon to supplement larely, and in some cases the Government has lent the money.

16,030. (*Chairman.*) Have you found the charges upon the Irish railways higher than upon the English railways ?—They are certainly high for passengers and for goods, although the trains are few, and the speed slow.

16,031. I believe that the returns to the Board of

Capt.M.Huish.

20 April 1866.

Trade hardly prove that the charges for 1st and 2nd class passengers are higher on Irish railways than on English railways ?—I believe you will find they are high.

16,032. There is one railway system in Ireland of very considerable length, not far short of 500 miles. Did you find that the charges upon that system were lower than upon the smaller lines ?—Perhaps the best worked line in Ireland is the Great Southern and Western, and the length of that is 160 miles from Dublin to Cork; that has been one of the most successful line in Ireland.

16,033. Did you find that the charges upon that line were lower than upon the small lines ? — The charges are very high upon it, and the trains are very few.

16,034. If your scheme was carried out, that line, I suppose, would be left very nearly as it is ?—It would take in the Cork and Macroom, the Cork and Bandon, the Cork and Youghal, and a variety of small lines, the Waterford and Limerick, and others.

16,035. Still there would be no great charge, so as to bring about any material alteration in the system upon which it is now managed ?—It is a very well managed railway, and I do not think that the evils I have alluded to are so grievous there as they are north of Dublin, where you have the Northen Counties, the Londonderry and Enniskillen, the Dublin and Drogheda, the Dublin and Meath, the Belfast Junction, and the Ulster.

16,036. (*Lord Stanley.*) You have spoken of making four separate groups of the Irish railways ; would not two or three be sufficient ?—Three might be sufficient. The Northern would be undivided, and the Midland Great Western would be the line of demarcation. There are one or two little lines that must fall into one system or the other. The Midland Great Western to Galway would be the second, the Great Southern and Western would be the third, and the Wicklow lines I contemplate would be the fourth.

16,037. (*Sir R. Hill.*) Might not the Wicklow lines be united with the Great Southern and Western? —Certainly ; it would be rather a large system, and that would make three instead of four.

16,038. (*Mr. Horsfall.*) Who do you think would object to such a scheme ?—I think, if it were to be thrown before the Irish public, with the authority of Parliament, that popular opinion would sooner or later carry it.

16,039. (*Sir R. Hill.*) Are the shares in the railways held chiefly in Ireland ?—That I cannot tell.

16,040. (*Chairman.*) Are you acquainted with the Great Southern and Western system ?—Very well.

16,041. Is that railway managed with spirit ?—It it is very well managed indeed.

16,042. Do you think there are as many trains run as the directors could be expected to run ?—I think not ; they have not, for instance, an express train from Dublin to Cork.

16,043. If you were a director of Irish railways, should you be disposed to recommend a reduction in the passenger fares ? — Supposing the railways to remain as they are ?

16,044. On the Great Southern and Western, for instance.—On that system they make 5 per cent. dividend by a struggle ; but that company has paid that dividend for a great number of years, and perhaps, if I were an Irish director, I might say, let well alone, I will not risk my 5 per cent. But I think that if there were these large amalgamations, and the companies felt tolerably secure against the intrusion of rivals (and I am not quite in favour of the same competition in Ireland that I should be in England, because the country does not afford the same ground for it), I think you would find that they would experimentally try the effect of reductions and running an increased number of trains. But there is anothea reason why I should like to see the Irish railways thrown into this form. If you are to have an extended railway system in Ireland,—and I know of nothing that is to do that country so much good,—it must be by one or the other of the existing companies that the extension must take place. At the present time there is that sort of fear of trenching upon each other's traffic, that nobody likes to put out a new line. Some speculators have put out some, but they are totally bankrupt, and there is no great encouragement to go on with an extension of the railway system in Ireland, and it can only be brought about, I think, upon a large scale by mapping out the country, and holding out inducements to existing corporations to complete their systems.

16,045. (*Lord Stanley.*) Do you think that the actual condition of Ireland, being as it is, an agricultural country,—a country without great towns, and for the most part a very poor population,—enables it to maintain a larger railway traffic than it does ?—If you were so far to economize the present system and to reduce the expenses, which I think my plan would, by some 25 or 30 per cent., you would enable these companies to economize the service to the public, and I am sure it would draw out traffic in that country.

16,046. Is not the failure of the Irish railways owing to their having been made through districts where there is no traffic to feed them ? — That is perfectly true. On one or two of the lines they run only two trains a day, and very few people go by them.

16,047. (*Sir R. Hill.*) Would it be possible to save as much as 25 per cent. upon the whole cost of working the trains ?—I really do think so. I am speaking roughly ; but when I see four servants and four engines employed to carry me, where one engine and one servant ought to do it, with all the machinery of boards, solicitors, secretaries, engineers, and a staff's variety of expensive junctions, all of which would be swept away by my plan, I cannot help thinking that a very improved result might be produced ; but whether it would be the figure I have glanced at, I cannot say.

16,048. If the saving so effected were employed in reducing the fares, do you think that a considerable reduction might be made without loss of revenue ?— Yes ; I think that they then would be emboldened to try the experiment from which they now shrink.

16,049. (*Capt. Galton.*) After you had given them such a monopoly of their respective districts, what inducements would they have to reduce their fares ? —I think they would try the experiment.

16,050. You appear to think that the only way of obtaining a reduction of fares in England is by competition ?—Yes ; but I do not think you can flood Ireland with railways as in England. In England you have now, with the exception of one or two large towns, duplicate or triplicate communications by different railways ; you have not got that in Ireland, nor are you likely to have ; they cannot have such a competition of railways.

16,051. That being so, how would you obtain for the public in Ireland the benefits of competition which are obtained in England ; I mean by giving a monopoly to certain Irish railway companies ?—Of course, you would have somewhat to introduce the paternal system of the continent, with a little more power in return for the benefits conferred.

16,052. That would give to some Government department the power of ordering what fares were to be charged by the railway companies ?—After they had paid a certain dividend, say 5 per cent., I believe the railway companies in Ireland, who do not see their way to it at present, would be very willing to try the experiment with any receipts above their fair return. I do not know that they would like the Board of Works in Ireland ; I think they would rather prefer the Board of Trade in England.

16,053. (*Chairman.*) As the only railway which is on a large scale has not tried any experiments, why do you suppose that the other companies, if amalgamated to the extent of 300 or 400 miles of railway, would make them ?—I may be too sanguine in believing that they would, but I think they would. Even assuming that

I am wrong in my supposition, you would still have a very large advantage in harmony of action and facility of transit which you have not now.

16,054. (*Mr. Horsfall.*) Is it not the fact that many of these railway companies pay nothing whatever?—Nothing whatever, and one or two of them are sold up. One was in the sheriff's hands only last week.

16,055. (*Sir R. Hill.*) You have spoken of assistance being given by the Government in the way of a loan; I presume you would recommend that that assistance should be given conditionally?—Yes, on these amalgamations or combinations taking place.

16,056. And also upon certain reductions in their charges being made?—Certainly.

16,057. Might you not by so doing diminish the security for the repayment of the loans?—Certainly. If you reduced the fares, and there was no success, you would *pro tanto* reduce the Government security. I suppose, therefore, the Government would take care, if they did anything, to say that the rates were not to be unduly reduced.

16,058. (*Mr. Hamilton.*) Do you see any other way of promoting amalgamation, which you think so desirable, except by putting an inducement before the shareholders of getting their debenture interest reduced?—They ought to do that undoubtedly for their own interest and protection. Any gentleman who has followed the course of the discussions at Irish railway meetings will know that there is scarcely one at which the subject is not ventilated by the shareholders, but the directors are too strong, I suppose, and the thing has never been carried out.

16,059. Will you be kind enough to say what form this encouragement to amalgamation is to take. How are we to make persons interested in railways in Ireland more alive to their interests than they are at present?—The shareholders are a very difficult body to deal with. There is no concert between them, they never meet hardly but in the general meetings, and there is no concert of action. In this country occasionally the proprietors do meet in large bodies, and they consult together as to their course of action, but in Ireland it is almost unheard of.

16,060. Do you think that a recommendation under authority, whether from this Commission, or from the Board of Trade, to the shareholders in Irish railways pointing out to them that it was their interest to amalgamate, would make any impression upon them?—Yes, a very great one.

16,061. Even without any pecuniary inducement being offered?—Yes; but I think a pecuniary inducement would clench the matter.

16,062. (*Mr. Horsfall.*) When you speak of pecuniary inducement, do you mean by means of a loan? Yes; by loans on their debentures, conditional upon the arrangement recommended by some Commission, or the Board of Trade, or Parliament, being carried out, which would afford the most ample security to the Government and at the same time give an additional impetus to the action of the proprietors.

16,063. You think that if a recommendation was given founded upon authority it would have weight with the shareholders?—I think it would be concurred in without any solatium.

16,064. (*Chairman.*) Have you considered the question whether it is advisable for the Government to purchase all the railways in Ireland?—I have.

16,065. Do you look with favour upon that suggestion?—No.

16,066. What special evils do you anticipate would result?—I have never been in favour of the Government undertaking the commercial management of railways in this country or in any other. I think it would open a door to a great deal of political partisanship, and it runs as high in Ireland as elsewhere. I do not think they would manage them better than the men whose trade it is to do it.

16,067. Would your objection equally apply if the Government purchased the railways and leased them to a joint stock company?—Then the Government would take the risk and the lessees the profit.

16,068. (*Sir R. Hill.*) You have stated that the total traffic in Ireland upon all the railways amounts to less, I think, than is taken in half a week by the largest of the railway companies in this country?—Yes.

16,069. That, I suppose, is the London and North-western Company?—Yes.

16,070. Can you say how the total capital expended upon the Irish railways compares with the total capital of that same company?—Very favourably. The Irish railways have been made cheaply.

16,071. But the total capital expended in Ireland, I presume, has been less?—Less per mile a great deal.

16,072. Less in total amount than that expended by the London and North-western Company?—That I do not recollect, but it has been very much less per mile.

16,073. The total appears to be about 25,000,000*l.* This is less, is it not, than the total capital expended on the London and North-western lines?—About half, I think.

16,074. Seeing that the whole of the Irish railways not only produce a smaller amount of income than the London and North-western system, but that the capital invested in Irish railways is in the aggregate less than that invested in the London and North-western system; seeing further that you are of opinion that by amalgamation, and other means, the current expenditure might be very largely reduced, do you see anything to prevent the formation of a company in this country to purchase the whole of the Irish railways, to supersede the present management altogether, and conduct them upon the principles which have been found to succeed in this country?—I think it would be more objected to by the 461 directors, than to leave them to allot their duties amongst themselves. They would look very jealously upon 25 gentlemen, say, from this country, going over there to do that which 461 had failed to do. I have no doubt there would be very considerable difficulty in inducing them to listen to it; but if it were pointed out by any authority in this country,—and these things are forcing themselves upon men's minds, although somehow or other they do not get brought before the whole body,—if it was once pointed out to them, and at any rate if the subject was fairly brought before them, and it was shown that the country would benefit by the system I have shadowed forth, and that their own pecuniary interests would be promoted, I believe it would be adopted. The best men now employed in managing Irish railways would be picked out for the general system. I should be sorry to see them taken out of Irishmen's hands and placed in the hands of Englishmen, for there are some very good railway managers and excellent directors in Ireland indeed, and they are Irishmen.

16,075. Of course a new company might select their managers and servants from the present staffs?—Yes. I should be sorry for the Commissioners to suppose that I think the Irish railways are not well manipulated, and comfortably and safely so; the stations are generally good.

16,076. You appear to be of opinion that for some reason or other the directors of Irish railways do not act in accordance with the interests of the proprietors of those same railways?—Of course that is placing it in a very difficult light for me to answer. I am sure that they do not think so; but I believe that they are not acting in the interests of the proprietors at all. I believe that the interests of the proprietors there is in the direction I have pointed out.

16,077. (*Chairman.*) Do you think that in so poor and thinly populated a country as Ireland it would answer to run a greater number of trains?—I do not mean anything in comparison with the English lines; but if you cheapen the transit, you hold out an inducement for greater accommodation; and when I find, going to Belfast from Dublin, that four engines,

Capt. M. Huish.
20 April 1866.

or at least three, are called into operation, with six drivers and firemen, and six guards, and that all this increased expense is incurred, when one engine would run me through, I am sure that the railway companies, when balancing their accounts, would find that they could afford to give more accommodation. You will find that railway companies are liberal towards the public, not from any sense of liberality, but because it reacts upon their own interests.

16,078. The three railways of which you spoke between Dublin and Belfast are, I believe, amongst the most prosperous railways in Ireland ?—The Irish North-western does not pay a dividend.

16,079. The three railways, I think, are the Ulster, the Dublin and Belfast Junction, and the Dublin and Drogheda ?—Yes.

16,080. They all three pay, do they not, a very good dividend ?—They pay, I believe, 4½ per cent.; but it might be much better.

16,081. (*Capt. Galton.*) Do you think that the amalgamation of the Northern lines would injuriously affect any of the ports which they now supply, or with which they have a connexion ?—A difficulty has just been imported into my scheme by the legislation of the present or the last Session of Parliament, and that is by giving the London and North-western Company a line in Ireland ; I mean the Grenore line : and that interposes a new interest, and an English one, in the very middle of this system of lines, and there difficulties I admit would arise, but they would have to be met as they arose.

16,082. (*Mr. Hamilton.*) I understand that, quite apart from the question of increased railway communication, you would recommend amalgamation as a means of economy, and therefore of increased profit ?—Certainly.

16,083. (*Capt. Galton.*) My question was whether, if you had this amalgamation of interests, the various ports to which the several railways would run would be injuriously affected by having one board for regulating the railways, rather than there being several whose interests lay with the several ports ?—No doubt my scheme is open to that objection. Of the four companies I have alluded to, one has its interests in the port of Londonderry, another at Drogheda, and another at Dublin, and there would be collision between those ports brought about by the fusion.

16,084. Do you think that the general benefit that would be obtained would counterbalance that ?—I think so.

16,085. (*Chairman.*) Have you any other suggestion to offer to the Commission as to the Irish railways ?—No.

The witness withdrew.

Mr. C. W. Eborall.

Mr. C. W. Eborall, examined.

16,086. (*Chairman.*) You are general manager of the South-eastern Railway Company ?—Yes.

16,087. Captain Gordon, the Superintendent of Stores at Woolwich Arsenal, has complained that the South-eastern Company will not undertake to deliver Government stores beyond the limits of their own line ?—That is not strictly correct. The Government Store Superintendent has desired us to carry, and has wished that those stores should be delivered at Portsmouth the same day or the day after. We have no railway to Portsmouth, but we have to London. We have a railway to Hastings, in the direction of Portsmouth, and all we can undertake to do is to send them by the usual goods train at night ; that is, either to London or to Hastings. Then the London, Brighton, and South Coast Railway, or the South-western, at Guildford, would take them forward. The goods trains usually go at night, and consequently there would be a day's delay. We have never refused to carry goods through, but we have refused to carry them through in a specific time, *i. e.*, for delivery the following day.

16,088. It must be a matter of great importance occasionally to the Government that their stores should be delivered within a fixed time. Is there any reason why the different railway companies should not come to an understanding to secure such punctual delivery within a limited period ?—I do not see any difficulty about it ; but we have been asked to do a specific thing as to forwarding stores.

16,089. Is it impossible to come to some understanding as to the speedy forwarding of Government stores ?—I do not see any difficulty about it.

16,090. From whom ought the proposal to proceed, from the Superintendent of Stores at Woolwich, or should the different railway companies, or their managers, meet and concert some scheme for this purpose ?—If the suggestion were to come from the Deputy Quartermaster General, or from the Storekeeper, I have no doubt that an organization might be made, so as to accomplish the object.

16,091. (*Mr. Hamilton.*) Why has not such an organization been made, because it appears that an application has been made on the subject ?—I do not believe it is a matter of any great moment. It has not been put forward to us as such, otherwise that might have been done. We are obliged to charge low rates for the carriage of these stores, and if we sent special trains with them they would be very costly to the companies, because the stores do not go in any very large quantities. It is sometimes a ton, and sometimes 30 hundredweight that have been sent. Very seldom a train load.

16,092. (*Capt. Galton.*) If they sent a gun from Woolwich to Portsmouth one day, when should you deliver it at Guildford ?—The next morning.

16,093. It would not even get to Guildford till the next morning ?—No, I apprehend it would be delivered in the evening at Woolwich.

16,094. It would take nearly 48 hours to get from Woolwich to Portsmouth, I suppose ?—Yes, I think it would.

16,095. I suppose it would come up by the night train from Woolwich to the Bricklayers' Arms, and arrive there at a certain time, and go down by the night goods train to Guildford ?—It would.

16,096. So that Woolwich not being on any main line running between London and Portsmouth, there is a certain amount of delay occasioned ?—Yes, at the junction.

16,097. At the Bricklayers' Arms ?—Yes.

16,098. (*Mr. Hamilton.*) Have you day as well as night goods trains from Woolwich ?—No, they are all in the night.

16,099. Then I suppose the real difficulty is, that before your goods train arrives the London and South-western Company's goods train has left ?—Yes, that is it ; and on the North Kent line it is a difficult thing to have the goods trains in the day time, even if we desired it, in consequence of the passenger trains running every few minutes, especially between Woolwich and London.

16,100. I suppose there is no unwillingness on the part of your company, the South-eastern Railway Company, to form through booking arrangements with the London and South-western Railway Company ?—None whatever.

16,101. (*Chairman.*) Have the Government officers ever pressed the point strongly upon your Board ?—They have not pressed it strongly upon us. I saw, I think it was, Colonel Gordon, some six week ago ; he asked why it could not be arranged, and I pointed out the difficulty to him at that time.

16,102. It has been stated by some of the witnesses that your company refused to make through rates for the carriage of coal for the London and North-western and other railway companies in that part of the country ; is that the case ?—The coal traffic into our district is comparatively a very small one ; most of the coal coming into the south-eastern district

comes to the ports of Whitstable and Strood; that is the north country coal. The coal from the midland counties is not sent in any large quantities, nor would the parties who send the coal consent to pay us a higher rate than they pay to the companies having the long lead, and we have objected to receive the coal at the same mileage rate as that at which the London and North-western and Great Western railway companies receive it for very long distances.

16,103. You are of opinion that it would not pay your company to carry it?—Certainly not, looking at the comparatively very small amount of traffic of that description on the line.

16,104. (*Capt. Galton.*) Have you through booking arrangements with all the lines?—Yes, for goods traffic.

16,105. Are you in the clearing house?—Yes.

16,106. (*Chairman.*) Is it a universal rule that when traffic such as coal is carried over a long distance the companies receive only in proportion to their mileage? Cannot arrangements be made in favour of companies that have only a small mileage?—Sometimes that is done, but seeing that we refuse a regular mileage rate that has never been arranged, it has never been thought necessary to arrange it.

16,107. (*Mr. Hamilton.*) At what points could those companies deliver coal upon your system?—At Reading, at Red Hill, and at Croydon.

16,108. Reading and Red Hill are practically the same?—We should receive it at Red Hill from the London and North-western district, and from the Great Western at Reading. The Brighton Company would bring the coal from the North-western system through the Croydon station, and hand it over to us at Red Hill.

16,109. By unbroken railway communication?—Yes.

16,110. (*Chairman.*) Have you a communication with Clapham Junction?—We have a communication, but we do not send traffic that way; we are not interested in the network of railways in that direction.

16,111. Does coal going from the north to the south of England pass at all by the Clapham junction station?—Yes; I believe it is carried that way by the Brighton Company.

16,112. (*Capt. Galton.*) Does the Brighton Company take this coal the long lead rate?—I do not know whether they do or not; they have taken a large quantity of coal down to Brighton, but at Brighton there is no port as there is near to Whitstable and at Dover, and there has been some guarantee to send a large quantity of coal down there at I believe a mileage rate; I am not quite certain about it, but that is a distance of 54 miles over their own railway. Now I do not suppose that we could carry coals to Dover; it is not likely that we should have coal from the north of England or from the Great Western district to Dover, and the sea-borne coal would not admit of its being carried down there at the rates.

16,113. Your unwillingness to make a through rate does not arise from any existing contract with the Brighton Railway Company?—Not at all.

16,114. (*Chairman.*) Can coal be delivered cheaper at the ports with which you are connected, Whitstable and Dover, than it can at Brighton?—Yes.

16,115. Sea-borne coal?—Yes, sea-borne coal.

16,117. Is that owing to Brighton being on the open sea?—Yes, there is no port or harbour there at all.

16,118. Are you in the habit of making through rates with the other railway companies to the north of London for general goods?—Yes.

16,118. I think it was stated by a witness from Bedford, one of the Messrs. Howard, the large agricultural implement makers, that they could not get through rates to your stations?—To some of the stations that is so.

16,119. The small stations?—I have some recollection of that matter. Some time ago we had through rates to all our stations, and we found the traffic was so extremely small that it was considered advisable (I believe it was the London and North-western Railway Company who suggested it) that certain places should be taken off the through rates, because there is a great deal of trouble connected with the invoicing and keeping accounts from all the stations on the London and North-western Railway to all the small stations on our line, and if the traffic is only a ton a year it is not worth while to have those arrangements in existence.

16,120. Are the parties subject to much additional inconvenience when they cannot get a through rate?—Very little in the case of these small stations, looking at the infinitesimal amount of traffic. Take for instance Marden; I suppose there is not a ton of traffic from the London and North-western system to that station in 12 months. We have through rates with the Great Northern, the North-western, the Great Western, and the Midland.

16,121. With all the more important companies to the north of England?—Yes, we have through rates with them to all the more important places on our line. We have a great many stations that are quite unimportant.

16,122. You are in the habit, like other railway companies, I suppose, of making terminal charges?—Yes.

16,123. Will you state to the Commission the principle upon which those terminal charges are made?—We make a charge for the loading and unloading and for the rent of the stations. We take the rent into consideration, as well all the expenses incidental to the unloading and loading of goods in the station.

16,124. Do you take into consideration interest on the money expended upon the sidings and stations?—Yes.

16,125. Does that form an ingredient in your calculation?—That forms an ingredient in fixing what the rates should be.

16,126. Do you see any objection to a maximum terminal charge being fixed by Act of Parliament?—Provided there was a sufficiently large margin, I do not see any objection to that. If you fixed a very low terminal charge for goods of light descriptions, it would be a great loss to the company.

16,127. (*Capt. Galton.*) What do you consider the terminal includes?—The cost of outlay on the station, the sidings, the repair of the sidings, the repair of the buildings, and labour.

16,128. When you say the repair of the buildings, you mean the station buildings?—Yes.

16,129. But you charge no terminal, and the Act of Parliament does not allow you to charge any terminal, upon passengers?—Not upon passengers.

16,130. You have stations for passengers, why then should there be a distinction as regards the terminal between passengers and goods?—You require more expensive stations for goods than you do for passengers, and more accommodation.

16,131. Do you mean for warehousing the goods?—I mean convenience for loading and unloading them. A passenger is in the carriage immediately, and the train goes off, but the goods have to lie about, and we have to provide conveniences for the goods.

16,132. You refer to cranes and articles of that kind?—Cranes and all articles required for lifting the goods, and placing them properly into the trucks, or for taking the goods out of the trucks and placing them on the platform.

16,133. (*Chairman.*) Do you consider that you are entitled to charge for the shunting of engines at the stations?—Yes, and that is a very expensive operation indeed. It is most expensive at some of the very large junction stations where trains have to be marshalled and divided. The cost of engine power at some of those stations, such as Normanton, for instance, must be enormous.

16,134. (*Sir R. Hill.*) If I understand you correctly, provided a fair and reasonable charge can be agreed upon for terminals, you would not object to a maxi-

Mr. W. Eborall.

30 April 1866.

mum being fixed by Act of Parliament?—I should not object to it. With reference to Captain Galton's question about terminals for passengers, certainly the railway companies have never made a charge of that kind, but I do not think that the companies are prohibited from making a charge for terminals on passengers.

16,135. (*Capt. Galton.*) You think that if, in addition to the mileage fare, a railway company added a certain sum for terminals, a passenger would not have any case if he summoned the company before a court of law for having charged more than the Parliamentary rate?—I think, seeing that we find porters for the passengers' luggage, and waiting rooms for the passengers themselves, we should be justified in making a charge, and I do not think anybody could recover against a company that did so.

16,136. (*Chairman.*) However, you do not regard it as being a practical question?—No.

16,137. Railway companies are not likely to charge more than their maximum fares, are they?—No.

16,138. Do you in many cases, or as a general rule, charge the maximum fare for passengers which you are authorized to charge by your Act?—No, certainly not; I should think we charge 20 or 25 per cent. below our maximum fares.

16,139. (*Capt. Galton.*) For all stations?—I should say for all stations.

16,140. Do you think there is any station to which you charge the maximum fare?—I do not think so. There are a great many stations where we charge, I should think, one half the fare.

16,141. To Woolwich and other places in that neighbourhood?—Yes; on the North Kent line.

16,142. (*Sir R. Hill.*) You charge the maximum fares by the Parliamentary trains, do you not?—No, we do not. I had better explain that matter. Take, for instance, Dover. There is a shorter line to Dover, and that shorter line is governed by the mileage rate of a penny a mile. If we charged our maximum rate to Dover the other company would take the traffic.

16,143. Do you charge your maximum fares by the Parliamentary trains as between Dover and Reigate?—I am not quite sure about that; it is possible that we might do so there, but I do not think we do.

16,144. (*Capt. Galton.*) Do not you charge the maximum fare to Folkstone?—No, we do not.

16,145. What is the first-class fare to Folkstone?—It is 16*s.*, I think, by the express train.

16,146. (*Mr. Hamilton.*) To Dover the express fare is 16*s.* 6*d.*, is it not?—16*s.* 6*d.* and 19*s.*

16,147. That has been materially reduced, has not it?—Yes, since the opening of the London, Chatham, and Dover line.

16,148. (*Chairman.*) Are your fares in any cases more to places short of Dover than the fare to Dover itself?—They are not actually more in any case; they are more in proportion to the distance in some cases.

16,149. The gross charge is not more?—Not the gross charge. We have instances where the charge to intermediate places is as high as to a place beyond them; take, for instance, Canterbury, which is on the way to Ramsgate and Margate. The fare to Canterbury is as high as the fare to Ramsgate and Margate; that arises from the competition with the steamboats.

16,150. You have prepared a statement, I believe, showing the comparison in different cases between English and continental railways?—Yes; I thought it would be interesting to the Commission.

16,151. You have no objection to put that statement in, have you?—I will put it in as part of my evidence. You will find that it refers to the charges for return tickets, and the different rates per mile for each class of passengers, taking the Northern railway of France as compared with the South-eastern railway.

16,152. Will you be so good as to state some of the more important results of this table?—It would appear that as regards return tickets we act on a more favourable principle with reference to the public than they do in France. We give more time and a greater per-centage of luggage. With regard to the charges for passengers, the continental fares are rather less than ours for first class, and they are somewhat less for second class, and about the same for parliamentary passengers.

16,153. For first and second class the continental fares are considerably below the English?—Yes; they are much below.

16,154. (*Sir R. Hill.*) You are speaking now of the single fares?—Yes. With regard to excursion fares, the fares in England are very much less. For instance, it is well known as between London and Dover that we issue third-class tickets to Dover and back for excusionists at 3*s.* 6*d.*; they have no such thing on the continent. These trains of ours are run generally every week.

16,155. (*Mr. Hamilton.*) Do they run excursion trains at all on the continent?—Yes, now and then, when there are very special circumstances or extraordinary fêtes they do run them.

16,156. Therefore you have no means of comparison between the English and continental railways in that respect?—Except that where we run a dozen I should think they would only run one. With reference to luggage, in France the allowance to passengers is 30 kilogrammes for each passenger, and all above that weight is charged for.

16,157. What is that in pounds?—60 lbs.

16,158. (*Lord Stanley.*) Rather more than that, 66 is it not?—65 lbs. and some decimal fraction.

16,159. Five to 11 is roughly the proportion between pounds and kilogrammes?—Yes; a kilogramme is equal to 2lbs. 3oz., English weight.

16,160. (*Capt. Galton.*) You have reckoned a kilogramme as 2 lbs.?—Yes. I have had some particulars taken out, taking the same distance on the Northern railway of France and on the South-eastern railway. In Belgium they allow no luggage at all, all luggage is charged for. Taking from London to Edenbridge, a station on our railway, which is about the same distance as from Brussels to Ghent, or from Paris to Ormoy, in France, the charge on the South-eastern railway first class is 7*s.* 2*d.*, the fare from Brussels to Ghent is 6*s.* 3*d.*, including luggage, and from Paris to Ormoy the fare is 5*s.* 8*d.* Taking from London to Dover, our charge for continental passengers is 19*s.*, and from Ostend to Malines the fare would be 15*s.* 8*d.* The fare from Paris to Amiens will be 13*s.* 4*d.* The second-class fare from London to Edenbridge is 5*s.*, with 100 lbs. of luggage free.

16,161. (*Mr. Hamilton.*) Do you allow 100 lbs. of luggage to a second-class passenger?—Yes.

16,162. Is not that an unusual allowance?—That is now becoming the usual allowance. We allow 120 lbs. for first-class passengers, 100 lbs. for second-class passengers, and 56 lbs. for third-class passengers. From Brussels to Ghent, second class, including the charge for 100 lbs. of luggage, the fare would be 4*s.* 10*d.*, and from Paris to Ormoy 4*s.* 3*d.* I have an example of the charge for a long distance in England compared with a similar distance on the continent. From London to Lancaster the fare first class is 2*l.* 1*s.*, with 120 lbs. of luggage free, as against the charge from Ostend to Cologne of 1*l.* 11*s.* 5*d.* for the first-class fare, and 10*s.* 7*d.* for 121 lbs. weight of luggage, making it 2*l.* 2*s.* as against 2*l.* 1*s.*

16,163. (*Chairman.*) It would appear that passengers travelling without luggage for short distances would have the advantage on the continent?—Yes.

16,164. (*Mr. Hamilton.*) Have you ever made a calculation of the average quantity of luggage, say of 100 passengers?—No. I have not done that, but we have an immense quantity of luggage carried on our line.

16,165. You cannot tell the Commission what would be a fair average allowance to make for luggage upon 100 first-class passengers?—No, I cannot do that.

16,166. (*Capt. Galton.*) Of course you have an extra amount of luggage for passengers going abroad?—Yes, they generally carry more luggage than other passengers, of course they must do so. With reference to the speed, the speed of the trains is very much in favour of the English railways. I have a table here showing the average speed of the different lines in France, and they are very much below the speeds on the South-eastern railway, where the speeds are about the same as they are on the London and North-western, the Great Northern, and the Great Western railways.

16,167. (*Chairman.*) I see on the first page that one of the columns is headed "In France, Belgium, and "Germany, per kilometre." Are the fares so nearly uniform in those three countries that this table would stand good for any one of those three countries?—The fares differ between Germany and Belgium, but there we have given the fares to Cologne.

16,168. You have made out, for instance, that for first-class passengers the rate is 1·720*d.*?—That is on the Northern railway of France only. I have not taken out the other railways. I have only made a comparison with the Northern of France.

16,169. It appears from the statement you have drawn up that the French railways in general are somewhat cheaper than the Belgian ones?—Taking into consideration the charge for luggage they are; when the luggage is charged for the French railways are cheaper than the Belgian railways.

16,170. (*Sir R. Hill.*) Comparing the English charges with those of France, and taking into account the allowance of luggage in each case, and the greater number of return tickets issued in England than in France, and all other circumstances, can you say in which country the charges are the higher?—Do you take into consideration at the same time the service afforded to the public.

16,171. I leave out of consideration the speed and frequency of the trains?—They are rather lower in France.

16,172. Have you made such a comparison as will enable you to inform the Commission by what per-centage they are lower?—No; I have only taken out those particular cases which appear in the table, which show a difference of about 20 per cent. in favour of the French railways.

16,173. But the charges are 20 per cent. lower in France than in England, taking all the circumstances into account which I have mentioned?—Yes.

16,174. But the speed is higher in this country?—The speed is higher and the trains are more frequent.

16,175. Will you have the goodness to make a similar comparison with the charges in Belgium, still taking into account the regulations regarding luggage and the greater extent to which return tickets and excursion trains are established in this country?—If you take everything into consideration, and take, for instance, passengers who have no luggage at all, I should think the difference would be from 15 to 20 per cent. in the case of Belgium; that is, if you take off the allowance for passengers who do not travel with luggage, the difference in favour of the Belgian railways would be from 15 to 20 per cent.

16,176. The charges in Belgium are from 15 to 20 per cent. lower than they are in this country, generally speaking?—Yes.

16,177. But the trains are less frequent and are at a much lower speed?—They are at a much slower speed in about one-half the number of trains, I should think, or perhaps less than that. For instance, take our own case as compared with French railways: we have 11 or 12 trains between Dover and London, and the French Company have only five trains between Boulogne and Paris.

16,178. Taking all circumstances into account then, the greater frequency of the trains in this country, the higher speed at which they run, and the greater liberality of the English railway companies as regards luggage and so forth, are you prepared to admit that the charges in Belgium are materially lower than they are in this country?—Seeing that time is of great moment in all business transactions and in every concern of life, I should say that the arrangements and charges are more beneficial to the public in England than in Belgium or France.

16,179. Probably you would be of opinion that, taking into account, as you say, the greater value of time in this country and the greater wealth of the inhabitants the existing systems are well adapted to the circumstances of the respective countries; that it is better to travel cheaper and slower in Belgium, and comparatively at higher fares and at greater speed in this country?—I should think myself that it would be better for the Belgians to charge more money and to travel at a greater speed, and also to give more convenience to the public with regard to the change of carriage; it is a most inconvenient thing in travelling in Belgium. You have to change carriages every few miles, and the delays are very serious.

16,180. (*Capt. Galton.*) You are turned out at stations where there is no platform and no covering at all, are you not?—Yes.

16,181. Do you think it is making a fair comparison to compare the number of trains between Dover and London with the number of trains between Boulogne and Paris, the distance between Dover and London being 88 miles, and the distance between Boulogne and Paris 106 miles; would it not be a fairer comparison to take from Paris to Amiens, and would you not in that way get more nearly the same number of trains that you have between Dover and London?—I think when you take into consideration the fact that there are two railways between Dover and London, and that there are 23 trains running between Dover and London, you will find that the comparison is in our favour very much.

16,182. In speaking of 23 trains you include those of the London, Chatham, and Dover Company too?—Yes.

16,183. Those are duplicate trains, are they not, in many instances; they start at exactly the same time as your own?—Not altogether, some do and some do not. Of course everybody knows that the railways in England have cost more than twice the money that the French railways and the Belgian State railways have cost. I have given in this table the cost of the Northern of France railway per mile, and the cost of the Belgian State railway, and the cost of the South-eastern; the cost of the Northern of France being 26,000*l.*, of the Belgian State, 19,000*l.*, and of the South-eastern 57,000*l.*

16,184. To what do you attribute the great extra cost of the English railways?—To the cost of the land chiefly, and also to the parliamentary expenses.

16,185. (*Sir R. Hill.*) Does not it arise very much from the circumstance of the French Government having executed a considerable part of the works?—Yes, in some cases.

16,186. The French Government has given great aid in the construction of railways, has it not?—It has.

16,187. In determining your fares you do not take the cost of the line into account at all, do you?—No, certainly not; if we did that we might suffer very much in our traffic.

16,188. (*Chairman.*) You merely base your fares upon what you consider will bring in the largest return to the railway company?—Exactly. On the Northern of France I see that the company in 12 months carried about 10,000,000 of passengers on 658 miles. On the Belgian State railways they carried 9,421,000 passengers on 467 miles, and on the South-eastern we carried 15,000,000 passengers on 291 miles.

16,189. (*Capt. Galton.*) Probably a great portion of your increased expense is due to your passing through a more densely populated country, where the land is more valuable in consequence of that circumstance?—To some extent that may be so.

16,190. I suppose the larger portion of these 15 millions of passengers are derived from the vicinity of

Mr. C. W. Eborall.

20 April 1866.

London and 20 miles round London?—Yes, a very large proportion of them.

16,191. (*Sir R. Hill.*) Does not a very large proportion of them consist of passengers who merely travel between London and Greenwich?—No, certainly not. I should think that would not be more than 2,400,000 out of the whole number.

16,192. (*Chairman.*) I also see that the working expenses per mile on these two continental railways are about 25 per cent. less in France and Belgium than on your line?—Yes, that chiefly arises from the additional trains which we run.

16,193. This is per actual mile of railway, not per mile run?—No, it is per mile of railway. If it were per mile run the result would be very different.

16,194. (*Capt. Galton.*) You show the result per mile run, I think. You show that it is on the Northern of France 2*s.* 7·3*d.* per train per mile, and on the South-eastern 2*s.* 10·7*d.*?—Yes.

16,195. Is that extra price per mile run due to greater speed?—Yes, very likely that would be so, and not only that, our expenses are greater at stations. We provide more porters, and every other expense is higher with us than on the continent.

16,196. (*Sir R. Hill.*) The salaries and wages are higher in this country, are they not?—Very much higher.

16,197. (*Mr. Hamilton.*) With regard to the porters' wages, do they on the continent pay them fully in wages?—No. I believe, although the rule is that they are not to get those "*gratifications*," they do get them.

16,198. Is that the rule?—That is the rule.

16,199. (*Chairman.*) I understood that there was much less of that sort of thing on the continent than here?—There is much more of it. There is a sort of digest of all the regulations and obligations of railway companies in France printed, and I have here an extract from it; I will read an extract to the Committee. "Manipulation of luggage.—We have to "remark here that the service rendered by porters is "gratis as regards the public, for they are paid by "the company. They are expressly forbidden to "ask gratuities of passengers."

16,200. Is that a document which you would be willing to lay before the Commission?—Yes.

16,201. Are there any points in it which you think would be of use to us?—Yes, I think it will be found useful. (The witness handed in the following statement, but more full translations will be found in appendix CK.)

REGULATIONS and OBLIGATIONS of RAILWAYS in FRANCE.

A company has no real or landed right in a railway. The ownership of it is in the State.

Upon expiration of the time for which a railway has been conceded it becomes the property of the State, and the Government then assumes all control

Porterage, (i. e., *collection and delivery,*) when not done by the company, it is entrusted to agents by agreement, which latter is subject to the approval of the minister.

The service rendered by porters is gratis as regards the public.

Conveyance of hay, straw, &c. The loading and unloading done by senders or consignee.

Provisions (*for the markets*) and certain articles, such as silver, gold, &c. The Government, upon the motion of the companies, reserve the right of annually regulating the tariffs.

Weighing of packages. The companies can levy no charge but by virtue of the confirmation of the minister.

Carriage of grain. The charges for conveyance are in some cases affected by the market price of it.

Charges for conveyance of passengers, goods, cattle, and other traffic. The companies have to prepare a table of proposed charges, and submit copies of same to certain Government officials.

When charges are reduced they cannot be further reduced or raised until after a lapse of three months in the case of passengers, and a year for goods.

A reduction must bear proportionately on the toll as well as transport,

Companies have to announce by placard a month previously, and advise Government of every tariff modification.

Any alteration made by Government in such tariff has to be re-published by the companies.

Companies neglecting to placard a reduction in the tariff are liable for damages sustained by any carrier whom the competition may have injured.

Differential rates between the extreme points of a railway, and as they affect intermediate stations.

Goods carried on private branches are subject to a special tariff.

The loading and unloading of waggons is generally at the expense and under the care of the consignees.

Reason for special rates to be assigned on submitting a proposition for prefectoral decision.

Joint or "through" tariffs to be approved of by Government.

The advantage of the through rates cannot be claimed for intermediate points.

Where special rates exist, if the senders neglect to demand that their goods be sent at such rates the companies can enforce the general tariff charges.

International traffic tariffs. Upon application, authority is given to companies to make such charges and conditions as are necessary to compete with other routes. They are also exempted from the preliminary placarding of the tariffs.

Rates the same for all seaports on the same railway and situated on the same stretch of coast.

Export traffic. Similar liberty to that given to international traffic is allowed.

The companies have to furnish Government with the tonnage, origin, nature, and destination, and the rates and conditions of the conveyance.

16,202. Are the figures in the statement which you have drawn up taken generally from the accounts of the French railways, or are they deductions which you have made from them?—I have got the particulars from the railways, and then I have worked them out into these figures. With reference to the Belgian State railways, for instance, I obtained the information from the Inspector of Railways, Monsieur Fassiaux; and with regard to the Northern of France, I obtained the information from the manager of that railway.

16,203. Are you acquainted with any other French railways besides the Northern of France?—We have to do with the Paris, Lyons, and Mediterranean, but we have not much to do with them. They refuse to book passengers through with England, except to Marseilles. We book through to Marseilles, but to no other place. We have never been able to get any of the French railways to book through to and from England, except the Northern of France and the Paris, Lyons, and Mediterranean as far as regards Marseilles.

16,204. (*Capt. Galton.*) What are their objections to it?—They think there is no necessity for it. There is a change of carriage at Paris, and they say passengers may just as well re-book at Paris.

16,205. (*Mr. Hamilton.*) The through rate from London to Paris is the full local rate on both railways, is it not?—Yes.

16,206. Then the public get absolutely nothing by the through rate?—They get a through ticket, that is all. Of course if it were divided on the mileage basis the Northern of France would get a greater benefit than they do.

16,207. Then, in fact, you get your share in a higher proportion than the Northern of France?—Yes.

16,208. (*Sir R. Hill.*) But you carry the passengers at a higher speed?—Yes, and our railway cost more money.

16,209. (*Mr. Hamilton.*) Are there any other charges besides that?—There is a charge at Dover for putting the passengers into the boat, that is, for taking the passengers over the Admiralty Pier, for which we have to pay.

16,210. That is included in the charge for the through ticket?—Yes, that is included in the charge. There is also a transference of baggage from the railway to the boat, and from the boat to the railway.

16,211. But there is a special charge made, is not

there, for booking the luggage ?—Yes, for registering the luggage.

16,212. Do you know what that charge is ?—I have not the rate here.

16,213. (*Capt. Galton.*) It is 1*s.*, is it not ?—No, it is more than that. There is a regular scale, but I have not the particulars here.

16,214. (*Mr. Hamilton.*) I mean for the mere booking of luggage ?—In addition to the registration charge there is 1*s.* per passenger.

16,215. Do you know what that is in France ?—It is 1*s.* in England, and 10*d.* in Paris.

16,216. Are you sure that it is 10*d.* in France ?—I believe so ; I believe the charge is a franc.

16,217. Would it be contrary to your information if you were told that it was 10 sous a parcel or package ?—Recently we have had some modifications made in those charges, and I am not quite sure that I am correct about it.*

You will find on looking through this statement which I have drawn up, that in France they are obliged to get the sanction of the minister of *Travaux publics* to rates before they are charged, and the tariff has to be exhibited at the different chambers of commerce, and also at the stations, and no modifications can be made in the routes without the sanction of the minister of public works. From my experience of the working of that regulation I think that it fetters business very much, and I do not see any advantage in it whatever.

16,218. (*Chairman.*) Do you know enough of the French railways to be able to say whether these figures would apply pretty generally to those railways ?—I should think they would. I think the French railways are very much alike. With reference to goods traffic our speed is much greater than that of the French railways. With what they call the *petite vitesse* they are allowed one day for the departure of the train, one day for the journey, another day for the delivery in the station, and another day for the delivery to the consignee. With us it is a question of a few hours.

16,219. I see your working expenses per mile come out to a little over 2*s.* 10*d.* ?—Yes.

16,220. Do you see your way to any possible reduction of the working expenses ?—No, I do not. I think myself that the greatest step in that direction recently has been the use of steel rails. I believe if those steel rails can be made cheaper (they are too expensive at present), that will reduce the expense of maintaining the permanent way considerably.

16,221. (*Capt. Galton.*) Could you divide the 2*s.* 10*d.* between the different heads of expenditure, showing the proportions for the repair of the permanent way, the rolling stock, and so on ?—Certainly ; I can do so if you desire it.

16,222. (*Chairman.*) The Board of Trade returns make it out for the average of all the different railways under seven or eight different heads I think ?—Yes.

16,223. Do you run a large number of your passenger trains with the carriages very partially occupied ?—I do not think we do ; I should say not.

16,224. Do you not think then that if the public required less accommodation in that way, any considerable reduction of expense could be effected ?—I think not. Certainly not on our North Kent line.

16,225. Have you any very large goods traffic on your line ?—No ; our goods traffic is very small, comparatively. Almost the whole of our goods traffic is in and out of London. We have a large goods traffic in and out of London ; but between one station and another on our line, away from London, we have only a very small goods traffic.

16,226. And you have no mineral traffic at all worth speaking of, I think ?—I should think we have about from 130,000 to 140,000 tons a year all over our line, that is, over nearly 300 miles of railway.

16,227. (*Capt. Galton.*) I see that your charges on the South-eastern railway appear to be nearly from 12 to 15 per cent. higher than those on the French railways, on this list of articles which you have given ?—Yes, I dare say that would be so.

16,228. (*Sir R. Hill.*) But are not the charges upon the South-eastern railway rather high as compared with those upon other English railways, for passengers, at least ?—No, that is not the case.

16,229. What do you put down as the average charge per mile for ordinary first-class passengers ?—2·50*d.*, that is, 2½*d.* ; that is the same as the Brighton Company's fare, I think.

16,230. The average first-class fare on all the principal railways, as shown by the Board of Trade returns, is about 2*d.*, I think ?—I was alluding to the Brighton Company. I dare say, taking the London and North-western Company, it would be different.

16,231. I am speaking of the average of all the ordinary first-class fares on all the great lines of this country ; that is about 2*d.* per mile, is it not ?—Yes, I believe that is so. Our fares are just the same as those of the Brighton Company. I think you are right as regards the London and North-western and some of the other lines. I am not quite sure about the Great Northern, but I think they have a higher fare.

16,232. I am giving the average, not of each, but of all the lines ?—Yes ; but then you take the short fares with the long fares. If you took our short fares together with our long fares you would bring the average down to a very low figure.

16,233. (*Chairman.*) Is there any other point to which you wish to call the attention of the Commission ?—There is one point which I should like to mention ; but perhaps it is scarcely within the province of this Commission, with reference to compensation for railway accidents. We have unfortunately been great sufferers from accidents, not as regards the number of accidents, but their character. The accidents on our line have been of a very serious nature, and we certainly have been terribly victimized. With reference to compensation some modification of the law is necessary, otherwise some small company might be ruined for years if they had such an accident as we had at Staplehurst. If the legislature could in some way or other fix the amount that should be paid in all cases, it would be a most desirable thing. There is a precedent for it in an Act of the London, Chatham, and Dover Company for working men, in which it is provided that the claim is not to exceed 100*l.* a passenger. Now we have had to pay even for people in a low class of life very large sums of money, and there is a desire on the part of solicitors, and even surgeons I am sorry to say, to connive at attempts to extort large sums of money from railway companies. As an illustration of that I will mention that I heard the other day of a case where a solicitor had said to a man who was injured in our Staplehurst accident that if he would give the case into his hands and leave it entirely in his hands, he would give him a thousand pounds. That is only one case out of a great number. We had one person who made a claim against the company and succeeded in getting compensation with regard to the Blackheath accident. He claimed again, alleging that he was injured in the Staplehurst accident, and we then discovered that he was an impostor and prosecuted him, and he is now in prison for two or three years. But there is such encouragement given to these enormous claims, and the railway companies are so much victimized, that I really think that something ought to be done to fix some reasonable price upon passengers who suffer

* "For registered luggage from London to Paris this company make no registration charge, and the rate is 1*s.* 6*d.* for each 10 lbs. weight of personal luggage over and above the allowance to the passenger. For the registration of luggage from Paris the charge to London in the same way is 1f. 75c. per 10 lbs, with 10 cents added for registration per transaction. The operation of weighing luggage on the French side is conducted with considerably more care than similar duty at this side, and the French employ besides much more accurate scales ('boscules') so that on the whole, as intended, the charges are brought to very nearly the same in each case."

Mr. C. W. Eborall.
20 April 1866.

from accidents. With reference to the Merchant Shipping Act I may mention that there is a sort of limitation there, and I do not see that railway companies should not have the same consideration.

16,234. How came the London, Chatham, and Dover Company to get that special exemption from the General Act?—They undertook to convey passengers at a very low rate in and out of London, to and from their metropolitan stations, and in consideration of that low fare, which was I think about 1*s.* a week or something of that kind, they had this special clause granted to them. If I had known that I should be permitted to go into this matter I would have brought with me to-day some strong cases showing how oppressive the operation of the present system has been to the South-eastern Company; but I have not the particulars here.

16,235. You think that a maximum ought to be fixed, beyond which railway companies should not be liable for accidents?—Yes.

16,236. (*Capt. Galton.*) Do you say that the London, Chatham, and Dover Company have got a clause inserted in one of their Acts limiting the amount of compensation?—Yes, as regards workmen.

16,237. You would limit the liability of all railway companies?—Exactly.

16,238. (*Sir R. Hill.*) Would you make the liability in proportion to the fare paid or something of that kind?—That would be a difficulty, it is a difficult question to determine how it should be done.

16,239. (*Capt. Galton.*) Would there be a maximum fixed for 1st, 2nd, and 3rd class passengers?—Yes.

16,240. Would you beyond that allow any person to insure if he chose to pay the insurance?—Yes.

16,241. Would you make the company, in the event of an accident happening to a passenger who had paid insurance, liable to pay the extra amount he was insured for just as they are in the case of goods under the Companies Act?—Yes.

16,242. That would be satisfactory to the companies I presume?—I think it would meet the purpose.

16,243. (*Sir R. Hill.*) In determining the fare to be charged for each class of passengers of course this liability for heavy compensation is a circumstance to be taken into account is it not?—Yes.

16,244. Seeing that compensation is much heavier in the case of a rich man than in that of a poor man, and that the rich man does not pay a higher fare than the poor man travelling in the same class, does it not follow that the present system involves this unfairness, viz., that the poor man has to pay a part of the insurance on the life of the rich man?—Yes; that is so.

16,245. (*Capt. Galton.*) Should you be willing in case such an arrangement were made, that whatever was the nature of the accident, a compensation should be paid to the passengers injured, whether the accident was one of those traceable to the direct negligence of a servant of the company, or was one of those accidents of trains running off the line, which are sometimes said to be nobody's fault?—I should think myself that it must apply to everything. I do not think you could make an exception, I do not think companies could plead anything of that sort if there was a limit of compensation fixed.

16,246. Would not that then do away with an enormous amount of litigation, which is now very injurious to the morality of the country?—Yes, there is no doubt about it. I recollect a case of a passenger who was injured on the South-eastern railway, and made a very heavy claim against the company. He came in a train to Charing Cross after the accident, walked away from the station, and went to his hotel, and the day following he found himself to be very unwell. He suddenly lost his memory and the use of his senses, and was apparently very ill for a long time, Very eminent surgeons said that he would never be well again, his mind was so much affected, that he would become perfectly imbecile for life. This was a very bad case and we had to pay 5,500*l.* compensation. We did not pay the money at first, for he being imbecile, and having no representatives to whom it could be paid, we objected to pay it. Then an alteration seemed to have taken place with reference to the man's mind when he was placed in that position, and he became better, and then an order was made to pay the money. He had it paid to him and I believe now he is comparatively well.

16,247. (*Mr. Hamilton.*) Taking a general view of this question, do you consider that the amounts which the railway companies have had to pay during a period of years have pressed heavily upon their profits?—Yes, very much so. It made a difference of 1 per cent. in our dividend last year.

16,248. Take a series of years?—We have paid enormously, taking the last ten years it has cost us about 6,000*l.* a year for accidents.

16,249. Does that include the last great accident?—No, without that.

16,250. What per-centage would that be upon your profits?—Taking the last accident into account it would be about $\frac{1}{3}$th per cent.

16,251. You mean to say about 4*s.* in the 100*l.*?—Yes, that is upon our ordinary share capital dividend. I mean that it has affected us to that extent.

16,252. And therefore it is materially less upon your total net receipts?—Yes, that is exclusive of the last accident, which will cost us when it is all settled nearly 70,000*l.*

16,253. (*Sir R. Hill.*) If the legislature limit your liability in the manner you suggest, you would probably think it not unreasonable that you should be required either on your own account, or on account of some other company to give insurance to any extent that a passenger may demand, on his paying for it?—I think it would be necessary to limit the amount.

16,254. But to any reasonable amount?—There must be a reasonable limit. We labour under another difficulty, that a judge cannot legally grant annuities, and therefore we are obliged to pay a certain sum down. Now in the event of a case like that passenger who was injured, and to whom we had to pay that heavy compensation, I have just mentioned, I have no doubt that we might have been able to have arranged, if it had been within the letter of the law, with the consent of the judge for an annuity, which would have been better than paying this very large sum of money. It might have been arranged that it should be so much a year for a certain number of years, and if the man was better at the end of that time, that it should be reduced to a certain amount below that, but as it was we had to pay a sum of money on the testimony that this man was injured for life.

The witness withdrew.

The following remarks were subsequently added by the witness:

PRECEDENTS for the alteration of the law in regard to the liability of companies in the case of accidents to passengers by railway.

1st. That the railway companies are commercial undertakings carried on for the mutual benefit of the companies and the public. Large capital is invested, and the object of such investments is the obtaining a fair profit for the investment.

In the case of carriage of goods by railways the Legislature has interfered for the protection of the carriers, for where goods are of a certain class, such as silk, gold, silver, jewellery, &c., the company have no means of ascertaining the nature and value of the goods carried and the consequent loss to them if any injury happens to such goods or the goods be lost,

unless some knowledge of the nature of the goods be given them. The Legislature has therefore by the Carriers Act protected the companies by requiring, where such goods are of a value exceeding 10*l.*, that the value should be declared and a certain insurance rate paid, and the companies are compelled to carry such goods upon such insurance being paid, but if no declaration of the nature and value is given then that the company should be relieved from responsibility. It is evident the intention of the Legislature was that carriers should not be compelled to carry without their own knowledge valuable goods, and at the same time be made liable for loss or damage.

By the Merchant Shipping Acts it is expressly provided that ship owners shall not be liable for loss or damage to passengers or goods beyond the value of the ship itself, and as to the case of injury to passengers the tonnage of the ship is put at a certain value and as to goods at a certain value. These are instances of the interference of the Legislature for the protection of carriers by land and sea, and therefore there is a precedent for the interference of the Legislature in some way to protect carriers by railway. It is not as if it was there was no precedent on the subject. It of course constantly happens that a railway company will contract to carry three passengers from A. to B., say by first class. The same remuneration in the way of fare to the company is paid by each person. The company have no knowledge and cannot possibly have any knowledge of the value in a pecuniary point of view of the lives they are carrying, and therefore no knowledge of the damages which they may be liable to in respect of these three persons in case of accident, neither is there any comparison between the remuneration and the risk. One of them may be only a clerk at a salary of 50*l.* a year, another may be a professional man earning an income from 5,000*l.* a year and which might cease on his death or serious injury; and the other might be a bishop, whose income would also depend upon his life. It is difficult to define what form legislation should assume in reference to protection to companies in cases of this kind. But it is submitted that it would be fair to the public and to railway companies if railway companies should be made liable in any event to a certain sum which the ticket should cover, subject of course to the proval of damages to the extent comprised in the limit, videlicet, a certain sum for a 1st-class passenger, a 2nd-class passenger, and a 3rd-class passenger. If the public should wish to protect themselves beyond that amount, then they should pay an extra sum by way of an insurance ticket issuable by the railway company; but in this case, as in the case of the Carriers Act, the passenger should not recover the full amount of his insurance unless he proved damage to that extent.

Mr. C. W. Eborall.
20 April 1866.

There is another defect in our law, with reference to railway compensations. It constantly occurs that cases are tried before the courts, in which the evidence goes to prove that the plaintiff is irreparably injured, and it turns out in the sequel that very shortly after the damages are paid, the plaintiff entirely recovers and is enabled to resume his former avocations. Juries should be authorized, in cases of trials where a question of the duration of the injury is brought in question, to give verdicts by way of annuity. There is, however, an objection to this, namely, that it is possible it would result in there being a second trial as to the question when the plaintiff had recovered. In order to avoid this it might be submitted in all cases to the arbitration of three medical men, to be appointed by the Board of Trade, and that they should have full judicial powers in the matter, and full power to deal with the costs of the arbitration, and it should be stipulated that it should not be in the form of a trial, that is, there should be no employment of attornies or counsel, but that the arbitrators should be empowered to call in before them such evidence as they thought proper.

Adjourned to Tuesday next at 12 o'clock.

Tuesday, 24th April 1866.

PRESENT:

THE RIGHT HON. THE EARL OF BELMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
THE HON. E. F. LEVESON GOWER, M.P.
T. B. HORSFALL, ESQ., M.P.
GEO. CARR GLYN, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

Mr. ALEXANDER CLUNES SHERRIFF, M.P., examined.

Mr. A. C. Sherriff, M.P.
24 April 1866.

16,255. (*Chairman.*) You have had many years' experience in railway management?—I have.

16,256. Will you be good enough to mention the railways with which you have been connected?—Originally with the York and North Midland Railway, which by amalgamation with the Leeds Northern and the York, Newcastle, and Berwick, became the North-eastern. Then I was traffic manager of the North-eastern Company so constituted. I afterwards left the North-eastern Company and went to the Oxford, Worcester, and Wolverhampton, which in its turn was amalgamated with the Worcester and Hereford and another railway, the Newport, Abergavenny, and Hereford, in South Wales, which became the West Midland system. That railway has since been amalgamated with the Great Western Company, and is now part of the Great Western system.

16,257. Your attention has been called, I believe, to some evidence that was given before this Commission by Mr. Oxlade?—It has. Before offering any evidence to the Commissioners upon the points of railway policy, I hope they will allow me to refer to and answer certain scandalous and untrue statements relating to myself, personally, made by Mr. William Oxlade to the Commissioners in the month of May of last year. The evidence of this person is contained in answer to questions No. 1888, 1889, 1890, 1891, and 1892. The statement is in itself incoherent and contradictory; but apart from this, I beg most solemnly to assure the Commissioners that it is a fabrication from beginning to end—a tissue of untruths without one fact to hang them upon. I cannot account for this man's motives in attacking me so mendaciously, unless they arise from a malicious desire for revenge in consequence of the part which my position as traffic manager of the North-eastern Railway compelled me to take in reference to his traffic in 1854, and my subsequent evidence in the Court of Common Pleas in the action which Mr. Oxlade brought against the North-eastern Railway Company. He has, however, fortunately for me, invented circumstances which enable me to call in the rebutting evidence of others, which, if the Commissioners will allow me, I will do. In answer to question 1888, Mr. Oxlade states that I sent for him in 1854, that he waited upon me by appointment, and that Mr. Mason was the party who went with him to see me. Mr. Mason was at that time passenger superintendent of the North-eastern Railway. He is now assistant general manager of the London and

Mr. A. C. Sherriff, M.P.

24 April 1886.

North-western Railway, and I have received from him a letter, which I will take the liberty of reading to the Commissioners:—

"London and North-western Railway,
"Assistant General Manager's Office,
"Euston Station, London, N.W.

"My dear Sir, 20th March 1866.

"In reference to the allegations made by Mr. William Oxlade before the Royal Commission on Railways on the 10th May last (questions 1888–9), to which my attention has been recently drawn, I unhesitatingly give the statement the most absolute and unqualified denial. There is not an atom of truth in the assertion that I ever attended you with Oxlade by appointment or otherwise, or that any such conversation as that related to the Commission took place in my hearing. I am not aware nor do I think it at all probable that any discussion as to coal rates and arrangements was raised or debated between you and Oxlade in my presence, as, at the time alluded to, viz., in 1864, and for several years previously, I held the post of passenger superintendent, and had neither the power nor the wish to interfere in any way with the rates and arrangements for the mineral and merchandise traffic. I need scarcely add that I do not believe there is a word of truth in the scandalous aspersions contained in Oxlade's evidence, and speaking as I do from an intimate official acquaintance of seventeen years' standing, I do not believe that any of your acts, official or otherwise, at any time would afford the slightest foundation for a charge of favouritism, undue preference, or of conduct in any sense reflecting upon your position as a railway officer or your honour as a gentleman. I am quite willing and indeed anxious to attend before the Railway Commission to repeat the foregoing statement, and to answer any questions the Commissioners may desire to put to me.

"I am,
"Yours faithfully,
"Chas. Mason,
"Assistant General Manager, London and
"North-western Railway."

Mr. Oxlade then details a conversation with me, in which I am made to demand a partnership with him; that I offered in return to give him an unlimited supply of trucks, to grant him long credit, and that "we," which I presume must refer either to the company, or to Mr. Mason and myself, will get his bills discounted for him; that I threatened, if these offers were rejected, that "we" would stop his trade; that he did refuse, and that his trade in less than three weeks was stopped. In answer to a question put by the Chairman, he stated that he did complain of his conduct, and could get no relief. He then proceeds to assail the character of other gentlemen in a similar way. In reference to these statements, I cannot do better than read to the Commission a letter which I have received from Captain O'Brien, who, in 1854 was, as he now is, general manager of the North-eastern Railway. His letter is in these terms:—

"North-eastern Railway Company,
"General Manager's Office, York,

"My dear Sir, 8th March 1866.

"I stated to the Royal Commissioners that Mr. Oxlade's account of his interview with you was no doubt altogether untrue, and I did not go farther into the matter, because the Chairman said they preferred to have the evidence direct from yourself.

"On further consideration it appears to me that I ought to give some grounds for the opinion I then expressed, and also that on some points affecting you, the Commissioners might wish to have before them evidence from me, as being the general manager of the company at the time these occurrences took place. You are charged with promising Mr. Oxlade, in consideration of your having an interest in his coke trade, an unlimited supply of waggons, low rates for carriage, long credit, and that the company would get his bills discounted for him. If Mr. Oxlade had known the internal system of the company and the distinctions between the duties done in the separate departments, he would certainly have avoided putting such promises into your mouth, as he would have known that you had no power to fulfil them. With regard to waggons, you might for a time have given him some preference, but there is no point as to which rival coal owners are more jealous of each other than this; and before long complaints of favouritism would have been made to me, or to or by North-eastern directors interested in the coal trade, with the certainty of immediate investigation. As to low rates, it so happened that at that time these rates on coke to Staffordshire were very much discussed and watched with great jealousy by the directors. They were invariably settled in committee, confirmed subsequently by the board, always with my cognizance, and generally with that of Mr. Harrison, our engineer. As to these particular rates, the traffic manager had really no discretion nor any power of favouring individuals. With regard to long credit and discounting bills, Mr. Oxlade was certainly not aware that everything connected with payment, credits, and bills passed neither through your department nor mine, but through that of the accountant exclusively, who brought all such matters under a separate committee, viz., the finance committee, and who received his orders from them directly without reference either to you or to me. Mr. Oxlade further states, that in August 1854, you, because he would not enter into the alleged arrangement with you, threatened to stop his trade if he did not do it; that in three weeks you did stop his trade; that he complained of this threat, but no relief was given, and that a few months afterwards you ceased to be connected with the North-eastern Railway. It may be hardly worth while noticing, and I only do it as another instance of Mr. Oxlade's habitual inaccuracy, that you did not leave the North-eastern Company for two years afterwards. I therefore go on to say that I am perfectly acquainted with the whole history of the stoppage of the waggons, and the reason why they were stopped. There never was any doubt or question about it. The reason which he now gives for the company's stopping these waggons is altogether untrue, and he must know that it is untrue, because he brought an action against the company on this precise point, and the matter was fully investigated in open court. The facts, as then brought out, are as follows:—Mr. Oxlade purchased coke in Durham, and forwarded it to Staffordshire, chiefly in North-eastern waggons. These waggons being detained in Staffordshire beyond the usual time, the North-eastern Company required the Staffordshire Company to pay them demurrage, but they refused, alleging that the fault did not rest with them, but rather with the manufacturers into whose sidings and premises the waggons had been taken. The Staffordshire Company applied, with reference to this demurrage, to Mr. Oxlade, who answered, under date September 14th, 1854:—"Yours of the 12th inst. to "hand, and, to save you any further trouble respecting the demurrage, please note I will not pay any "demurrage to any railway company." The Staffordshire Company thereupon gave notice to the North-eastern Company in these words:—"We must "beg to decline receiving any more coke in your "waggons on account of Mr. Oxlade. He has evidently sent the coke here prior to its being sold, "and we now have some waggons here that have "been standing nearly a month." The North-eastern Company then applied to Oxlade himself to pay demurrage, who gave them notice in return that he would pay no demurrage. The North-eastern Company then gave him notice that they would not allow their waggons, loaded with his coke, to go off their own line. Oxlade persisted, however, in getting North-eastern waggons loaded and ticketted for Staffordshire, and the North-eastern Company then gave him notice that they would not allow any more of their waggons to be loaded for him for places off their line. Notwithstanding this, he surreptitiously got some of their waggons so loaded and ticketted, and

these, inadvertently, were hauled by the company to York. There, according to their previous notice, the waggons were unloaded, and the coke was stacked in the company's yard. Oxlade thereupon brought an action in the Court of Exchequer, averring, first, that we would not carry his coke beyond Altofts (Normanton), the southern terminus of the North-eastern Railway, for Great Bridge, in Staffordshire, where he had consigned them, and, secondly, that we had converted his coke to our own use. The case was tried at York, in July 1856. Payment for the coke which had been unloaded and stacked was made to the plaintiff in Court, which disposed of the second part, and he was nonsuited on the first, with leave to move. This he did, and the rule was refused with costs, Mr. Baron Martin using the words—"I am "most clearly of opinion, on the evidence which I "have before me, that there is no cause of action by "Mr. Oxlade in respect of these waggons of coke, "which are said to have been tendered them to con-"vey; I really am disposed to deal with this case on "the substance of it. On the part of the counsel for "the company the case is unanswerable." It is also clear to me that this allegation of Mr. Oxlade's against you is an afterthought, because if there had been any ground for it it would have been long ago stated either to me or to the directors, and would not have been kept secret for eleven years. Moreover, it was subsequent to this period that the very long investigation took place before Master Parke, at which Mr. Oxlade and his solicitor brought out every point they could think of—among others this particular one of not paying demurrage, and the trucks being stopped, but they never ventured on such a charge as is now alleged; indeed it never was suggested that the stoppage of the trucks was done on any other grounds, or for any other reason, than that Mr. Oxlade refused to pay demurrage if detention occurred off the company's own line.

"I am, my dear Sir,

"Yours truly,

"W. O'Brien."

"A. C. Sherriff, Esq., M.P."

In addition, I would refer the Commissioners to Brown's Railway and Canal Act Cases, page 24, and to the appendix, page 29, in which Oxlade's case is stated, and the judgment of Mr. Justice Creswell given, and it will be observed that in the judgment reference is frequently made to my own evidence. The evidence spoken of was given by me before the Master, Mr. Parke, and I may add to the remarks in Captain O'Brien's letter that, to the best of my recollection, I was ten days under examination in this matter, during three or four of which I was under the cross-examination of Mr. Oxlade and his solicitor, and that never during the course of this protracted inquiry was a single word of this story told, or even hinted at, although Mr. Oxlade was present during the whole time. I am really unable to give any further explanation to the Commissioners than that which I have now offered. The man is either revengeful or mad, I do not know which of the two.

16,258. Will you be so good as to favour the Commission with your opinion as to the principle of uniformity of rates?—I do not believe in the policy of establishing on railways one uniform mileage rate of charges for the conveyance of passengers, goods, or minerals, and I am strongly of opinion that if the legislature were to compel railway companies to adopt such a system they would commit a great injustice as respects railway property, and inflict on the commercial interests of the country a most severe blow.

16,259. Will you state in the first instance why you think they would be injurious or unjust to the railway companies?—If the principle of uniformity were forced on the railway companies, they must, in justice to themselves, adopt fares and rates much exceeding their present average, in fact sums equal to, or approaching the maximum charges authorized by their respective Acts. This change would not materially disturb the short distance traffic, because, as a rule, I believe maximum rates are charged for short distances, but it would vitally affect a vast proportion of the long mileage traffic. In fact the alteration would, I am certain, annihilate the bulk of it.

Mr. A. C. Sherriff, M.P.

24 April 1866.

16,260. (*Capt. Galton.*) Do you mean uniform rates for goods?—Yes. Some places and industries would benefit for a time, no doubt, but in the end all would suffer. Besides, if railway companies are compelled to adopt a system of uniform rates, so in common justice ought canal companies and persons trading on those canals, steam packet companies, and even carriers by road, for railway companies compete, as a matter of course, with all these classes of carriers,—coastwise, by inland navigation, and even by road. So that a uniform rate would certainly have to apply to all the carrying interests, whether on railways or outside of them.

16,261. (*Chairman.*) Do you know whether the rates charged on canals are usually more uniform than on railways?—I do not think they are. I believe that the canal rates are generally much less uniform. I believe that there is an immense number of vessels trading upon canals that pretty nearly take anything they can get at times, just to keep their boats working.

16,262. (*Capt. Galton.*) Are the tolls on the canals tolerably uniform?—Yes. On some canals, such as the Birmingham canal, they are very uniform, the traffic is large, and the works are all situated on the side of the canal. I fancy they are pretty uniform, at any rate I suppose they are, from my experience of them. I take it that those canals which are successful canals are pretty rigid with their tolls, and in the case of those which suffer a very considerable amount of competition, I daresay the tolls are elastic.

16,263. There is no uniformity between the charges made by the persons who carry the goods?—No; and there has always been a difficulty in such cases, for railway companies have been always anxious to get an understanding with canal companies, they sometimes charging a few pence more per ton, and at other times charging the same rate, according to the circumstances of the traffic, but they have never been able in any way to bind the persons who are the owners of the boats, or those who hire the boats.

16,264. A canal is more like a public road or highway on which any person may take a boat who pays the toll?—Yes, it is.

16,265. (*Mr. Horsfall.*) But that principle exists upon all railways, does it not?—Yes. Special rates certainly are in the same category, although not to the same extent, they are forced upon them. I take it that all parties are to meet the circumstances of the traffic in their respective districts by as low a rate as possible, if they find it will be in any way remunerative to them; but that is the difficulty, in fixing any average rate, which would, I think, prevent that practice being carried out.

16,266. You would not, I suppose, approve of a railway company charging a higher rate for a short distance than for a long one?—Yes, I should. A short distance rate is always necessarily a higher one than for a long distance.

16,267. In proportion to the mileage?—Yes.

16,268. Would you approve of a railway company charging a lower rate, for instance, from Birmingham to London, than from Liverpool to London?—I should not say that I should condemn that altogether; it by no means follows that the most profitable part of the bargain would not be the low rate, it depends upon the circumstances, the quantity and variety of the produce. I would not say that I should not approve of it. I have done it many times myself, and I think I was perfectly justified in doing it. If there is a large traffic, say between Liverpool and London, hundreds of tons of goods in train loads, it is easily gone about; it costs the company a great deal less than the traffic within 10 miles of London, which would be conveyed in smaller quantities, and there would be more trouble and expense attending it. I think it is

Mr. A. C. Sherriff, M.P.

24 April 1866.

objectional always to do it, if it could be avoided, but I should not condemn it without knowing the particular circumstances.

16,269. (*Mr. Glyn.*) You would, I suppose, leave the board of directors to regulate that as they think fit, being governed by their maximum charges?—Yes; their maximum charges are what Parliament has fixed as the boundary beyond which they shall not go. I think that it cannot be left better than it has been.

16,270. (*Mr. Horsfall.*) Is there a maximum charge with regard to parcels?—There is practically a maximum, but parcels are interfered with in two ways—by the packed parcels companies, and to a small extent by the Post Office; and although there is no maximum in many Acts of Parliament, still there is a long settled price, which is seldom or never exceeded.

16,271. You would not say, I suppose, that it was justifiable for a railway company to take a parcel 200 miles for less than they would take it 120 miles for?—I should like to know the circumstances of the case. I am not prepared off-hand to give an opinion even on a point of that kind, for I know very well it would neither be satisfactory to the Commission nor to me. I would deal with that as with the question of goods. There may be circumstances that would justify it, but I admit that they ought to be strong circumstances to justify such a thing.

16,272. On the London and North-western railway would it be right to charge a smaller sum for a parcel from Liverpool than on a parcel from Tamworth going only half the distance, but to the same place?—Supposing that there were between Liverpool and London half a dozen packed parcels ——

16,273. I do not speak of those; I mean single parcels?—If there were packed parcels companies trading between Liverpool and London, and a steamboat also trading between Liverpool and London, each taking parcels at low rates, I should not say that I would not take parcels to compete with those companies to London, and at the same time charge the ordinary rate as between Tamworth and London.

16,274. (*Capt. Galton.*) It would be more beneficial to the public that a railway company should charge a low rate for parcels where there was that competition going on, and charge the full maximum rate between the towns where there was none, rather than cease to carry parcels between the places where competition existed?—Yes. Although there may be no Parliamentary maximum for parcels, I believe that parcels, according to the maximum which railway companies charge for them, are not overcharged. I say that it is far better that they should be allowed at certain places to charge the maximum which is understood; and if Parliament has not limited it, it might be limited, and to charge a low competing price at other places, than it would be to confine them to one uniform rate throughout the country.

16,275. (*Mr. Horsfall.*) There is no maximum as to parcels, is there?—That is the fault of Parliament. I should have no objection, nor would railway companies, I think, that Parliament should fix a maximum rate on parcels as on passengers and on goods. The adoption of a plan of uniform rates would put an end to competition between railway companies and steam or sailing vessels trading coastwise, and also in most cases as between railways themselves, and give the traffic to the water conveyance in the first case, and to the shortest route in the latter, as will be shown in the following examples. Take first the immense traffic between Newcastle and other ports and places on the east coast and London. The railway companies, in order to compete with the steamers and sailing vessels which trade regularly between these places, have reduced their rates to an extremely low figure. At the same time they charge from and to certain inland stations on their own lines which cannot be served by water a different and higher amount, although such amount may be more or less under the maximum allowed by their Acts. The low-rated traffic the railway companies consider as competitive and exceptional, the station-to-station traffic as regular and ordinary.

If they were compelled to name an uniform mileage rate, they could not adopt the low exceptional charge, because by such a course they would so reduce their aggregate net income as to prevent payment of interest and dividend. But although the exceptional rate would not answer as an average one, the competitive traffic carried under it leaves a certain amount of net profit after payment of expenses, and may therefore, to a certain extent, be called remunerative.

The withdrawal of the low rate would it is evident be tantamount to a rejection of the traffic, and accordingly a certain amount of net revenue would be lost to the railway companies. This loss would of course form an element in the consideration of an uniform mileage rate, and the result would be the application of a higher charge between inland stations, in order to make up for the loss of the coasting trade. This trade would be handed over to the water carriers, and, inasmuch as the uniform rate adopted by the railway companies would leave a large margin within which the water carriers might safely operate, the traders would be called upon to pay an increased freight by sea; so that, with the exception of the shipping interest, it appears to me that all parties would suffer by the adoption of an uniform rate such as I have described, say between the east coast, Newcastle, Sunderland, and other places and London.

16,276. (*Mr. Glyn.*) In fact competition would be removed?—It would be removed entirely from the water, and the water carriers would have a margin for higher rates, which, I need not tell you, they would take the advantage of levying, and the consequence would be that all parties, except the water carriers, would suffer. I will next take a case as amongst railway companies themselves. Between London and Manchester there are four great systems of railways, the London and North-western, the Great Western, the Great Northern, and the Midland. They compete for the traffic at equal through rates and fares, although each of them differs, as respects mileage distance between the places. The public uses all of them, because, although the charges are alike, the number and times of trains, the position of stations, and other local circumstances ensure to each company a proportion of the traffic, and conduces greatly to the public convenience. Compel uniformity of mileage rate, and, as it seems to me, this accommodation vanishes, and the traffic must be carried by the company possessing the shortest route, who would retain it until a shorter route should be constructed. It would be useless to multiply instances, they occur at almost every large centre of traffic throughout the country. As between Birmingham and London, referring to the London and North-western and Great Western companies, the one is 112 miles, and the other 130, and if they were to charge an uniform rate, it would give the London traffic all to the London and North-western Company, but as between Oxford and London you would give it all to the Great Western Company, as their line is much the shorter route.

16,277. (*Earl of Belmore.*) Have not railway companies the right, even where there is no competition, to carry for a longer distance at the same or even lower rates than for a shorter distance, where by charging a higher rate for the longer distance than for the shorter distance they would destroy the traffic for the longer distance?—Yes; they have the power.

16,278. Have they the right?—I think so, and for the reasons I have stated. I see no one who is damaged by it; no one has any cause to complain about it if a man is paying within his maximum for 40 or 50 miles. It is impossible to create and to nourish traffic for 100 miles without charging a low rate; and I do not think that the man upon the 40 miles is damnified by the arrangement which the railway company makes. I will endeavour to illustrate it by giving

Mr. A. C. Sherriff, M.P.

24 April 1866.

the Commission an instance to explain my meaning, in a case in which I myself am a trader. In venturing to express an opinion that the present system is the only practicable one, and that it would be most unwise to meddle with it to any extent, I do not deny that there are attendant anomalies, and even cases of hardship, but in the main I believe that the public are admirably served, and I say so, not only as one who has had practical experience of over a quarter of a century in the management of railways, but also as a person largely interested in trading concerns which pay considerably over 100,000*l.* per annum for railway transit. With one slight exception I have not seen the evidence on this subject given by traders to the Commission ; but from my own experience I can easily understand the character of that evidence. I do not believe that established cases of favouritism, that is, of giving one trader in a district any advantage over another trader in the same district, can with justice be alleged against railway companies, because from what I know of boards and managers, such a preference could not be given. The utmost possible jealousy is always manifested on this head, and I firmly believe that equality of treatment is the invariable rule ; I mean with persons in the same district.

16,279. (*Mr. Horsfall.*) You are now speaking of the present system ?—Yes.

16,280. It has been stated in evidence that formerly the plan used to be adopted of giving one trader a preference over another ?—I am speaking now of what exists at the present moment. Many years ago when such things would have been done they would have been borrowed in a great degree from private carriers who had no fixed rates, and who charged just as much as they could get from anybody.

16,281. (*Capt. Galton.*) You have had experience both as a railway manager and as a trader ?—Yes.

16,282. You have very large works in Durham, have you not ?—Yes.

16,283. And also engine works at Worcester ?—I am the chairman of those works ; but I am a partner of the works in the north. It is very likely, I know it from experience, that the traders in one district may complain that the traders in another district have lower rates than are given to them. I have no doubt that that is so, because it has come under my own notice repeatedly ; and they do not appear to have the knowledge that, generally speaking, they have in their own district rates which are quite as low. For example, if a man wants a low rate for grain between Worcester and London, he generally comes and tells you that a certain low rate exists between Liverpool and London ; and I might point out to him, as I have done repeatedly, that there is no necessity for this low rate as between Worcester and London for grain ; but that they have in other industries between Worcester and London a lower rate probably than exists between Liverpool and London.

16,284. You contend that the present system of charging such rates as the railway company can obtain enables traders from different districts to compete with each other in a particular market?—Yes.

16,285. Which would be entirely prevented by a system of uniform rates ?—Yes, entirely ; and I can refer to a case in which I am myself interested, which will show, I think, the way in which this power of railway companies, which they consider a beneficial one, operates. I am partner in an iron-smelting concern at Ferry Hill, in the county of Durham. We are, as regards transit accommodation, entirely in the hands of the North-eastern Company, as neither coal nor iron ore is procured on the spot, but they are conveyed from places more or less distant on the North-eastern line ; and I need hardly say that the cost of carriage of these raw products is a material consideration with us. The North-eastern Company charge us a certain amount for coke per ton per mile from the various collieries, which is not excessive, and is not complained of. But the North-eastern Company, in conjunction with the Midland and London and North-western Railways, convey coke from the same places for iron-making purposes to the Midland, Cumberland, and South Staffordshire districts, and for this traffic they charge a rate per ton per mile considerably lower than is charged to us and other pig-iron makers in their own district. Now, as iron-masters, this low rate affects us in two ways : it cheapens the cost of fuel to our competitors in the districts I have mentioned, and it thus enables them to rival us in certain markets for the manufactured article. Next it is the means of withdrawing large quantities of coke from the Durham district, and consequently raises the price of the article to us. And thus by increasing the cost price of our pig iron still further reduces our capabilities of competition with these distant makers. We applied therefore to the North-eastern Company, and asked them either to raise the rates of carriage to the districts in question, which we should have preferred, or to reduce our rates to the same level as theirs, and we supported our views by the reasons I have just stated, and by an argument that we conceived to be perhaps stronger than the other, and which was that the railway company, by assisting to withdraw so large a quantity of coke from the district, were raising the price to themselves, inasmuch as they were by far the largest consumers of coke in the district.

The North-eastern Company did not accede to our request, and to justify their refusal pointed out many local advantages which we possessed, and many low rates which, in conjunction with the Midland and London and North-western Companies, had been quoted for the carriage of our pig iron to the stations of these companies, and among others, to an exceedingly low rate to South Staffordshire itself, which enabled us to send very considerable quantities of pig iron into the very district of our opponents. I will not say that these reasons were entirely satisfactory to many of us, because some of us considered that the coke rate should be advanced to distant makers, and that there were good reasons for continuing the low charge for pig iron from the Cleveland district to the places which now used the article ; but it is quite possible that an authority having no private interests to serve, and looking only at the public advantage, might decide that the North-eastern directors were right in the decision at which they had arrived, and that we, the Cleveland traders, were wrong.

16,286. By the system of charging special rates the railway company becomes the arbiter as to what the trade of a particular district shall be, does it not ?—Yes, and a very fit one, I think, because their own interests are involved in the matter.

16,287. You mean in developing trade to the largest extent ?—Yes, on their respective lines.

16,288. (*Mr. Glyn.*) It is therefore safe in their hands, you think ?—I consider it is quite safe in their hands, and I have given, I think, one of the best examples of it. Instead of building our furnaces where we might have had competition by water, we have built them in the very centre of the North-eastern district where we have no other railway, and in truth at the last amalgamation we advocated it, because we find it is better to have to deal with one large system of railways than with half a dozen systems with a view to getting our trade developed.

16,289. (*Capt. Galton.*) You think it is quite sufficient to trust to the railway company, its interest being to develop the traffic to the utmost extent ?—I do. At times it is possible that traders and railway companies may have different views on the subject, but I would as soon trust the railway companies as anyone. The trader may have a little difficulty at times in getting rates which he may consider to be low enough, but upon the whole it is safer, I believe, in the hands of the traders and the railway companies than in the hands of any other tribunal.

16,290. (*Mr. Glyn.*) They are working a very

Mr. A. C. Sherriff, M.P.

24 April 1866.

large capital, and they have always the greatest interest in developing the traffic ?—Yes.

16,291. (*Mr. Horsfall.*) Instead of leaving it in the hands of the railway company, would it not be rather more satisfactory to the trader to let the matter go to arbitration ?—I do not believe that arbitration is worth anything. I believe it would lead to more evils that it would cure. I do not know who would arbitrate. I know of no one who has the necessary information, and who could arbitrate upon the matter to satisfy either the one or the other. In my experience of 35 years I do not know that the public have been so interfered with or injured by the present system as to make any change desirable. I maintain that, although there may be a few discrepancies and hardships, upon the whole, the public have been admirably served by the railway companies.

16,292. That is no doubt your opinion, and I do not say that it is not correct, but supposing that the traders think otherwise, and are dissatisfied, why should you object to arbitration ?—Because it would lead to continual interruptions in the course of the traffic, and for one evil that it would cure, it would bring in half a dozen others. I would therefore leave the matter as it is.

16,293. (*Chairman.*) You think that the best plan is to leave it to the traders to fight out with the companies the question of rates ?—Yes, and they always do that. The railway companies are continually before Parliament unfortunately, and there is always an opportunity to make complaints ; if there is any hardship, it always comes out in those Parliamentary conflicts, but there are very few cases of hardship. I have heard very few indeed brought forward before Parliamentary Committees, and I believe that in reality, when they are properly sifted they appear to be causeless, or nearly so. I believe that the present system is better than any other, and that it is continually getting better.

16,294. (*Mr. Horsfall.*) No doubt it would be as you say in the case of a large trader, that he would fight the company and come before a Committee and make his complaint, but take the case of the small traders, they would not be so well able to do so ?—They could do it by combination, and they have again and again brought evidence before Committees in the case of the amalgamations of new lines ; not one trader alone, but a number of traders have combined together.

16,295. (*Mr. Glyn.*) I think you have said that a new classification of goods might be an advantage ?—Yes, I think so.

16,296. (*Chairman.*) Is the system at present in force on the North-eastern railway the same as that which prevailed when you were manager ?—I think so.

16,297. Was the system then to carry at equal rates from all the different ports ?—No.

16,298. You are probably aware that the traders of Hull complain that Hull is placed at a disadvantage as compared with other ports to the north, Hartlepool and ports on the Tyne ?—Yes. I lived in Hull some time, and I think if you were to make a mileage rate of it, that the next thing would be that Goole, from being much nearer, would get the traffic, and Hull would then complain that the traffic was taken to another place. Any place up the river, from 20 to 30 miles, would then have an advantage, which would draw vessels there, and I think upon the whole that the North-eastern Company have done right in making a uniform rate, leaving it to develop the respective ports.

16,299. You think, generally, that the enforcement of uniform rates would be destructive of a large part of the traffic that now exists ?—I do most sincerely believe that such a system would be one of the greatest blows that could possibly be given to the commerce of this country. I say that because I know that the average rates for goods and minerals have really been in course of reduction from year to year, and the tendency of railway management is really to reduce the average rates which are charged.

16,300. What are the causes in operation which lead to that gradual reduction of the rates ?—The fact is that railway managers and boards of directors have to obtain their information as regards traffic from their respective local agents and local managers. These men are in constant communication with the traders of the district, and their own position in the company depends in a great measure upon the increased trade which they bring to their respective stations. Therefore you will always find that the local agents are advocates for low rates, in order to bring a large increase of traffic to their respective stations. That is its effect ; I have seen it in my own experience. I believe that local rates have been very considerably reduced, and that they are in course of reduction now from that cause. The weight has been increased, and the average rates are reduced. There is one point connected with low special rates which I should like to bring before the notice of the Commissioners. Connected with the issue of low special rates there is one stipulation made now and then, much less frequently now than in the past, as a condition attendant upon their being given, which I believe to be unjust to the majority of traders, and injurious to the companies themselves—I mean when quantity is made the essence of such an issue. A contract strictly founded on such a basis is the nearest approach within my knowledge to acts of favouritism by railway companies, as its effect must often be to benefit large producers or consumers, and to inflict a penalty upon smaller ones.

16,301. (*Capt. Galton.*) You think that a special rate should not be given to individuals in consequence of that, but to the whole class of traders ?—Yes ; and I will endeavour to explain that. I do not question either the legality or fairness of making what are called differential rates when the circumstances are greatly disproportionate, and when the cost to the company for performing the service is manifestly dissimilar, but I will refer to cases of a more doubtful character, which I will endeavour to describe. I will assume the case to be connected with the transit of coal, and that the localities in question are South Wales and London, it being understood that I have no reason whatever for selecting these places to illustrate my meaning. It must be taken for granted that application has been made by one or more of the colliery owners to the railway companies occupying the country between South Wales and London, to reduce the existing coal rates between these places, with a view to a larger quantity being sent than had hitherto been transmitted. The first consideration of the railway companies would be whether the reduction applied for would ensure to them an amount of net revenue so much in excess of that at present derived as would justify them in reducing the existing rate, and their inquiries would naturally be directed to clearing that point from doubt. In the first instance I can easily imagine a large colliery owner who raises his thousands of tons per day being in a position to say to the railway company, I will relieve you from any difficulty on that head. The quantity sent from my collieries at present by sea and the increase which may naturally be anticipated from the convenience and certainty which attend railway transit, when compared with sea-going vessels, justify me in offering to send by your line two train loads of coal per day of 100 tons a train a day, or say 60,000 tons a year, provided that if that quantity is sent you will allow me a drawback of a certain amount per ton, and, if I fail in forwarding the weight, charging me as you change other persons sending a similar quantity. Such a proposal would be very tempting, and an arrangement founded upon it would not act unfairly, if he were the only colliery owner in the locality, or if all the others were equal to him in respect of the quantity of coal raised and forwarded ; but if the district contained a number of collieries varying in size and importance, producing the same character of coal, and sending it to the same market, the case would in my opinion be materially altered. Some of these collieries

might be able to send only one train per day, perhaps two of them might have to combine to send a train ; but it seems to me unjust, in circumstances where the expense of transit to the company must be nearly the same, to inflict a penalty upon the smaller trader, because it is physically impossible for him to comply with the conditions which would entitle him to the drawback or minimum rate. That is the only ground for an exceptional rate, which in my experience is highly objectionable to the public at large.

16,302. (*Mr. Glyn.*) You would give a reduced rate to the large traders in the same district ?—Yes ; I hold that it should be extended to the whole trade if it is worth while to do it at all.

16,303. (*Mr. Horsfall.*) Has not this system been already adopted on most lines of railway ?—I really do not know, I am afraid not ; years ago I know it was not adopted on lines of railway ; at all events there have been cases where it has not been adopted. But I think it is a most just principle, and ought to be universally applied.

16,304. (*Chairman.*) Do you think that it is beginning to be generally reduced as the duty of all railway companies so to deal with the traders ?—I think so ; I think there ought to be no departure from such a principle. Years ago it was a very common thing to make a bargain, and to say to a trader, if you will send 100,000 tons we will give you a rate lower than the ordinary one. I know that it must inflict upon small traders a hardship, because it either reduces their profit or keeps them out of the market altogether. I now come to a very important matter, viz., the employment of private waggons on railways.

16,305. Will you be good enough to state your views as to the employment of private waggons on railways ?—As connected with the transit, but especially with that of coal and coke, the subject of the employment by colliery owners and merchants of their own railway trucks has, no doubt, occupied much of the attention of the Commission. During my active connexion with the management of railways, this feature of railway traffic was being constantly and unpleasantly forced upon our attention. Whenever detentions occurred, no matter from what cause, they were set down, not so much to neglect on the part of the railway company, as to a systematic determination to give their own stock and that of other railway companies a priority of transit over the waggons of private traders. I am quite convinced that such an impression is ill-founded, because I believe that railway boards, as a rule, issue positive instructions that no selection of this kind shall be made, and that railway managers are really anxious to facilitate the working of these trucks ; yet I am bound to express my opinion that in very many cases these waggons do not run the number of miles which might be got out of them under different arrangements. It is true that very often the delays arise from faults of the consignors or consignees, involving delays at stations especially ; but it seems to me exceedingly likely that the absence of any active interest to prevent these delays on the part of railway companies does not tend to render the detentions less frequent or of shorter duration.

16,306. (*Capt. Galton.*) If a person to whom a waggon was consigned with goods was required to pay demurrage for it, as he would be in the case of the waggon belonging to the railway company, he would be more likely to send it back soon than when it came from a private trader, in which case he would not be called upon to pay demurrage ?—It is a matter between the seller and the buyer. The railway companies in many cases know nothing of the transactions between these men. A coal owner loads a quantity of coal for his customers at various places, and sometimes the customer says, I never ordered that quantity, and the consequence is that the coal stands in the waggons to the great disadvantage, no doubt, of the company, at the stations, blocking up the place, and a great deal of inconvenience arises from it.

16,307. What would take place in the case of the waggons if the whole of them were owned by the railway company. Would the persons sending the coal take care to send a smaller quantity, so that the waggon should not stand in the way, or would the person to whom it was consigned be more likely to unload it directly ?—I think if the railway company found all the waggons, and if the colliery owner was in the habit of sending more than was ordered, that they would unload their waggons, and charge the colliery owner with the expense ; but when the waggon is not the railway company's waggon, there is no inducement to take that trouble.

Mr. A. C. Sherriff, M.P.

24 April 1866.

16,308. (*Mr. Glyn.*) In point of fact the waggons are used as depôts ?—Yes. I think it is very injurious to the traders, because the number of waggons employed by each is greatly in excess of the quantity actually required to satisfy their separate average requirements, whilst in the case of exceptionable spirts in trade, they have no help from the surplus stock ; and because, although traders cannot control the transit of their stock, and are entirely in the hands of the railway companies as to its proper working, any irregularity involves them in increased expenses and loss of trade ; for example, if a man has 40 or 50 waggons, and they represent the average quantity that he sends out, unless they are kept working regularly, daily, he will sustain a loss ; a few hours' delay may cause him very great expense. Take the case of coal, or people who raise the coal over the pit's side, it is of very material consequence to their profits, that if there are 10,000 waggons in the trade, those 10,000 waggons should do all that 10,000 waggons can do, and I do not believe that they do anything of the kind. I say, therefore, that it is very injurious to the traders, because instead of having an opportunity, if they have a large call upon them, of choosing from a large stock, because some traders would probably not have that opportunity, when a large call comes upon them they are compelled to fall back upon their own limited number, and then the delay, either on the part of their customers, or on the part of the railway companies, throws them on their backs.

16,309. (*Mr. Gower.*) You would not prohibit railway companies from sending private trucks ?—No, but I should be inclined to compel them to find the trucks. I think it would be a compulsion that would do them good, if you enabled them to purchase the trucks, and gave them an opportunity of doing so. I think that the present system is injurious to them in the main. There are some cases of large collieries, like that of Clay Cross, from which train loads per day run to London, and I dare say it does not matter whether they are the railway company's trucks or not ; but take a great number of cases out of London, I think it is a waste of power for a number of people to have each of them a stock of trucks, when the whole might belong to one interest, and be distributed as they were required.

16,310. As I understand you, it would be to the advantage of both the railway companies and of the traders that a change of system should take place ?—Decidedly.

16,311. Would not the present state of things which you have described almost ensure a change without any compulsion ?—It has not done so yet, and the employment of private waggons has now got to an immense head. Upon any railway with which I have been connected I should gladly have found the waggons but for one reason, and that was poverty; and I really believe that poverty on the part of railway companies has been at the root of the matter, and the cause why these private waggons have been employed; it has been from the impossibility in many cases of railway companies raising the necessary amount to supply stock, and therefore it has fallen upon the public to do it, but I believe it would have been better if the railway companies had done it.

16,312. (*Capt. Galton.*) Do you think it would economize all the working expenses ?— I think it would, and I am coming to that point.

Mr. C. Sherriff, M.P.

4 April 1866.

16,313. (*Chairman.*) The practice I believe is different upon different railways as to the employment of private waggons ?—Yes; the North-eastern Company are a company that find nearly all the waggons, there are a few private waggons, but not many.

16,314. (*Mr. Gower.*) Would there not be this objection to compelling the railway companies to buy up the private trucks, that it would depreciate the property which the private traders now have in their trucks ?—I would oblige them to buy those trucks. I believe that the railway companies would buy those private trucks. I see no reason why they should not purchase the stock which is running on their own line The present state of things I think is a disadvantage, it costs a great deal more money than it ought to do. There should be an arrangement between the traders and the railway companies, and I think that there would be great advantage to be obtained by having all the stock in one hand.

16,315. (*Mr. Glyn.*) Upon the whole do you not think that there would be a saving of capital ?—Yes; and of great danger and inconvenience. I believe that there would be a very considerable saving in the number of expenses.

16,316. (*Capt. Galton.*) And perhaps the operation might be made to extend over several years ?—Yes.

16,317. (*Chairman.*) Have you any memoranda on which you could base any reduction in the amount of the rolling stock that was required, if it was all in the hands of the railway companies ?—Not at the present moment, but I believe that taking into account all the rolling stock of the private traders, two-thirds of it would do the work that the whole of it now does, if the whole were in the hands of one interest who could use it as it was wanted, and keep it as it were on its legs.

16,318. (*Capt. Galton.*) That is to say, one-third of the capital invested might be saved ?—Yes: and I will just mention to the Commissioners why I think that railway companies ought to be parties to this plan. The present system is most injurious to railway companies, because it involves the moving to and fro of a vast amount of useless dead weight. It necessitates at stations, sidings, and junctions a greatly increased amount of that very expensive and destructive operation of shunting in order to effect the proper marshalling of trains. It prevents the back loading of trucks, and consequently increases greatly what every railway manager is anxious to avoid, the conveyance of empty vehicles for which no charge is made. It is attended with an increased chance of break-downs during the journey, arising in many cases from the faulty construction of private waggons, poverty of materials, and lack of attention to their being in good running order; and lastly the combination of these circumstances involve delay and danger, the importance of which it is impossible to overestimate. There is nothing more usual than to have what is called a pick-up train, which consumes more time at the stations in shunting than upon any journey throughout. I know that, in consequence of shunting, pick-up trains, for months together on the West Midland line, did not make more than about eight miles an hour, and it is not only a loss of time, but it is dangerous at junctions, because at many places, at stations, the main line is generally fouled in the operation of shunting, and it always causes a very considerable increase of danger to have the line fouled at any time.

16,319. (*Earl of Belmore.*) What do you mean by the expression "fouled?"—While they are shunting, a certain portion of the train is standing on the main line. At all the considerable stations they have sidings, and they take the train off the main line; but at small stations where they have to be served with coal, there is nothing but the main line and the sidings where the trucks are put on.

16,320. (*Mr. Glyn.*) You cannot dispense with the shunting ?—No; but I want to dispense with it as much as possible. By having a number of waggons in one of the small stations, which have all to be put in separate places, you increase the time occupied in shunting, and you increase the danger as well as increase the expense. The shunting must go on, but it ought to be lessened as much as it can be. Then, as a rule, railway companies have not that control over the kind of stock which they run, or as to the condition in which it is. It is true that all private waggons are supposed to be examined by the company's engineer.

16,321. Is not that a very material consideration? —A very material one, for I believe that the stock of private traders is not, generally speaking, looked at with that minuteness which the stock of the railway company is, and it is in bad running order. On many occasions the vehicles themselves are defective in make and in quality, and they are not kept in that good running order which the railway companies would keep them in if they were their own. I think it would be an excellent arrangement if railway companies could find all the waggons that were required.

16,322. (*Chairman.*) Do you think that private traders would be willing to part with their waggons ? —On fair terms no doubt they would. Their transit now costs them a certain amount per ton; they can either hire them or buy them, and at the end of the year they calculate what the material moved in them costs them per ton. They have therefore all the data requisite for an arrangement with the railway companies, and which I believe must conduce to the interests of both.

16,323. (*Mr. Glyn.*) Would there not be a great saving of capital ?—A very large saving, and I think it would be very easy to get over the difficulty of the railway companies buying the stock if you gave them borrowing powers in addition to the power which they now have, which is about to the extent of one-third of their share capital. I would allow them on certain conditions to borrow the requisite amount of money to enable them to purchase these waggons, and I do not see that any harm would come to any one. It would be impossible for many of the railway companies to do it unless that power was given to them, because their borrowing powers are exhausted, and their share capital is also spent.

16,324. (*Chairman.*) Would it be possible to confine these additional borrowing powers to the purchasing of the rolling stock ?—Yes; I think there could be nothing more easy than to keep railway companies right with their borrowing powers. I would have them in the Gazette every three months. I would require them to make a declaration of the money they had borrowed, so that it might be perfectly well understood which company had and which company had not exceeded its powers. The present system is really no protection whatever, because railway companies can borrow money in other ways than by debentures, and they do so. I think that if a declaration was made, and no company would object to it, they would be kept right by being compelled to make a declaration that the sums borrowed are what they state they are.

16,325. Will you be kind enough to state your views as to terminal charges ?—This is a very vexed question, and I confess that I am unable to make any recommendation to the Commission, which, to my own mind, while it did justice to the railway companies, would also protect the public. Terminal charges must of necessity vary greatly at different places, inasmuch as the expense of the services performed vary as well. The cost of these services depends on local circumstances entirely. It is contingent on the quantity of traffic dealt with, upon its character, upon the different amounts paid for rates, gas, packing straw, labour, cost of land and sidings, expense of stations, distance of the consignor or consignee from the station, and many other items.

16,326. Will you state what, according to your view, railway companies are entitled to include under "terminal charges ?"—Everything but the transit.

16,327. The cost of the land, and the rails, or the sidings ?—Yes ; and the labour of shunting ; and, in fact, all the expense off the main line.

16,328. Do you think that all these properly come under the terms "loading" and "unloading" ?—I think that the tolls given in the Acts of Parliament are for the mere transit of an article on a railway, and that whatever is plus that they have a fair right to charge a reasonable sum for.

16,329. (*Earl of Belmore.*) Do you think that a railway company has a right to receive any profit out of terminals ?—No.

16,330. (*Mr. Horsfall.*) Should you include the cost of the stations ?—Yes, a per-centage upon the cost of the stations.

16,331. (*Mr. Glyn.*) You mean, I suppose, that part of the station appropriated to the goods traffic ?—Yes.

16,332. (*Mr. Horsfall.*) Do you see any objection to fixing a classified maximum ?—Yes, I see an objection. If there is anything to be done it is by fixing the maximums afresh, and if you did that you would give to railway companies an authority to charge a maximum, independently of what it cost.

16,333. (*Lord Stanley.*) You would perhaps prefer to leave it as it is now, and that it should be a reasonable charge ?—Yes, because in the county court they will say whether it is so or not.

16,334. (*Mr. Horsfall.*) Would you compel a railway company to say how much was for mileage rate, and how much for terminals, or otherwise ?—No, it only comes in when the railway companies charge their maximum rates ; the terminal is only a question there.

16,335. You mean where there is no competition ?—Yes.

16,336. And no special rates ?—Yes, a special rate ; but in many cases the rate is not altogether so much as they could charge for mileage ; the question of maximum only comes in where it is plus the tolls.

16,337. In such cases would you make it compulsory upon a railway company to exhibit both charges separately ?—I do not see what good it would do, because the Act tells what the dues are, and the charge made would tell what the dues are, with the terminal added.

16,338. (*Chairman.*) When you were manager of a railway did you find that many complaints were made by traders as to the terminal charges ?—No, it is quite a new outcry, that about terminal charges. We had only one rule, and that was this, we calculated what the cost was per ton at any station to which rates were given, and then if we charged the maximum rate from any station to that particular one, we added on that cost.

16,339. (*Mr. Glyn.*) If the trader chose to do the cartage himself you would allow him to do it ?—Yes, and we have an allowance for that.

16,340. (*Mr. Horsfall.*) What is the test of what a reasonable charge is ?—A case might be taken to a county court jury, and of all people in the world they are the last to whom I should like to entrust railway interest.

16,341. Then suppose it to have been heard before a county court judge, and you were dissatisfied with the decision, you could take it into a higher court ?—Railway companies do not do that, they think it is better to endure the ills they know of than to run the risk of others.

16,342. Would you have any objection to make the decision of the county court final ?—Not the slightest, for I believe there is nothing to be feared from the county court judges. I would take their decision as soon as anybody's decision, but I was speaking of the county court jury, who generally decide the question in the county court, and these juries are composed of the very people who are interested in such cases being decided against the railway companies.

16,343. You would be satisfied with the decision of the county court judge ?—Yes ; but certainly not with that of a county court jury. The judgment of the county court judge is his own opinion, and without putting the question to the jury I think it would be quite satisfactory.

16,344. (*Chairman.*) Upon the railways with which you were connected formerly, were there any considerable varieties of terminal charges for goods at different stations ?—Yes ; according to the expense of that particular station.

16,345. Do you think that the terminal charges which are recognized at the clearing house are a fair index of the average expenses which railway companies incur ?—I do not think they have much connexion with the matter ; it is merely a give-and-take matter.

16,346. They are not founded upon a rough estimate of what might be expected to be the cost ?—I believe that I was amongst the first persons that agreed to terminals ; at all events I was amongst the first managers who did so, but I am afraid it was rather a rule of thumb then. From time to time at various places there have been applications for increased terminals on some particular grounds.

16,347. Are the terminal charges which are recognized at the clearing house tolerably satisfactory to all the railway companies ?—We hear now and then of a company saying that they have peculiar burdens, and wanting more money. I think they are satisfactory to the companies, and throughout the kingdom, generally speaking, it is something like, I think, 4*s.* for a terminal in the country and 8*s.* 6*d.* in London.

16,348. Do you see any objection to railway companies publishing at a station what the terminal charges are there ?—I do not see any objection to it except this, that everybody must do it ; all the carriers must do it if the railway company does it.

16,349. (*Capt. Galton.*) Are you now speaking of the rates generally ?—Yes.

16,350. (*Chairman.*) I was referring to the terminal charges ?—Then I do not see much advantage in that. I do not see any objection to its being carried into effect, but it depends upon the character of the goods ; some are very different from others, there are light and bulky goods, and goods that come to a place in large quantities which must be dealt with in a different way from goods that come in small quantities, and I think it would afford no criterion, because the cases are so dissimilar, and the goods——

16,351. What I mean is, that at each station there should be a board hung up in some conspicuous place from which every trader might know what the terminals for goods were at that place ?—At some places they could not say anything of the kind, for if goods are carried from that station at a special rate the railway company cannot tell what is terminal and what is mileage, they get just as much as the traffic will bear under their Parliamentary rates ; the mileage sum may be 2*s.* and the terminal sum 4*s.*, but I am sure they could not publish it because they do not know it. With regard to the exhibition of the goods' rates themselves, if all carriers did so, I do not see any objection to it, except that in places where there are thousands of rates it would be rather a lengthy and expensive thing to do.

16,352. (*Capt. Galton.*) Is that great complication of rates inevitable ?—I think so. I believe they cannot get rid of them, if they could they would. At large stations they employ clerks who attend to nothing else but that.

16,353. (*Mr. Horsfall.*) That is as much in the interest of the trader as in that of the railway company ?—Yes.

16354. (*Mr. Glyn.*) There might be no difficulty in having a book of rates to refer to ?—No ; except that I should not like, if I had, for instance, a station at Newcastle, to have my rates exhibited in order that the trading companies might come and see what I was charging to the public, and then go to the parties and offer to take a few shillings less, so as to secure the traffic. I think it should be a give-and-take business.

16,355. (*Lord Stanley.*) That is to say, if one company does it, all must do it ?—Yes.

Mr. A. C. Sherriff, M.P.

24 April 1866.

16,356. (*Capt. Galton.*) Not only railway companies ?—No, I mean all carrying companies. Then again it is not so much the rates that one company has to guard against as against another thing; there is a system of drawbacks upon rates, and a variety of other things of that kind. If the rate named is 20*s.* a ton, and if one steamboat company gives six months credit and a railway company gives one, that amounts in reality to a great reduction of the rate by the steamboat company, and so they must declare that those rates were independent of drawbacks, discount, and so on. I do not see why any railway company should refuse to exhibit these rates on their walls, or in the goods office. If it were done by every one, I do not believe there would be any objection made to it.

16,357. (*Chairman.*) I believe that the objection made by several of the railway managers is that they would amount to several millions of rates ?—Upon the whole, the rates are very large, no doubt. There are stations where there are hundreds of thousands of rates.

16,358. You would refer merely to the rates charged from each station ?—Yes, that could be done, and I do not think that the railway companies ought to object to that.

16,359. Are you of opinion that there should be some alteration as to the classification of goods ?—Yes ; I think that the classes in the Acts of Parliament are altogether inadequate to the present circumstances of the times, and that they afford no indication of what should be charged. I should have supposed that the best way would have been to take the railway classification which from year to year is an index of the commerce of the country in some shape, and so regulate the tolls and dues to be charged.

16,360. (*Mr. Glyn.*) That is, in fact, the result of the experience gained during the years since the railway system was first introduced ?—Yes.

16,361. (*Chairman.*) There is a classification of goods in several of the railway Acts ; is that the same now as it always has been from the commencement ?—It was borrowed, I believe, in the first instance, from the canals, and it has been very little altered indeed during the last 25 years.

16,362. Would you recommend that some general Act should be passed superseding all these, which are no indication of what is charged ?—Yes. I would take the classes which railway companies have adopted, and which I think ought to be made public, and which give a variety of classes of goods, and a certain index as to what is charged by the railway companies throughout the country. I believe that that classification, although it is not used exclusively, is to a very great extent used, not only for the through traffic, but for the traffic on the company's own lines. I do not know that the public ever see this classification, but I think that they are materially affected by it.

16,363. (*Capt. Galton.*) All the goods in any particular class, except a special class, are charged alike, are they not ? If you wanted to give a special rate upon any article in class 3, for instance, it would have to be removed into a special class, would it not ?—I will take an article, which will illustrate what I have to say. Supposing that flax is, over the whole kingdom, in the 3rd class, but suppose, at the same time, that between two points, Hull and Leeds, it forms the largest item of traffic between the two places, then you would, if the 1st class was low enough to get it, remove it out of the 4th or the 3rd class into the 1st for that particular district. But that would not take it out of the general classification for the whole kingdom, as there might be only one ton of flax carried between two places in the interior, and 500 tons carried between Hull and Leeds ; still, that is the mode in which it is done—they take it out of one class and put it into another when they can.

16,364. The normal condition of things is that each article in the same class is charged at the same rate ?—Yes ; there is a special rate between certain places, including the whole of the articles in one class.

16,365. (*Chairman.*) Are there any very material discrepancies between the classifications of the several railway companies that have been adopted by the clearing house ?—The Acts of Parliament are really so meagre that I can hardly answer the question, and when you consider that the classification is to be composed of all the articles enumerated there, you will see how very few there are in the railway Acts.

16,366. (*Capt. Galton.*) Do you think that the classification of the goods should be published ?—Yes.

16,367. If a certain article is removed, as between particular stations, from one class to another, do you think that at one of the stations there should be a notification of it ?—Yes. If you carry out the principle of every company publishing the rates, it would be shown in that way at each station, by being taken out of one classification and put into another.

16,368. Is not the classification very frequently revised at the clearing house ?—It used to be revised, I think, once a year.

16,369. According to the interests of the traders ?—Yes ; when certain new articles are very often introduced. If a certain article has become one of importance in any part of a district, and a trade has sprung up in that district, I dare say this would take place,—first, the manager on whose line that article was, would wish for a low rate in order to have it introduced throughout the country, and if it goes on, he applies to the clearing house to have it put into a class in the classification which, in reality, bears out the position which experience dictates it should be in. But the circumstances of the country are altering, so that it is impossible, I think, to fix any definite rule.

16,370. (*Chairman.*) If the alteration in the classification of goods which you recommend was carried out, would it not be necessary also to alter the toll classes, or would one include the other as a matter of course ?—I rather think it would.

16,371. (*Capt. Galton.*) Would you propose to have a given classification, sanctioned by Act of Parliament, in a general Act, subject to be amended periodically by the clearing house ?—Yes.

16,372. (*Mr. Glyn.*) When you talk of the clearing house, you mean a meeting of the managers, do you not ?—As all they do is to go before the delegates at the clearing house, I take it that when I speak of the clearing house, I speak of all.

16,373. No rates are altered by the clearing house ?—Not rates. I was speaking of the classes.

16,374. (*Chairman.*) You do not mean that it is necessary there should be a uniform system of maximum charges for all the railway companies ?—No.

16,375. You would leave that matter open ?—Yes.

16,376. Each company should have its own tolls ?—Yes. I mean simply a classification on which the rates should be founded.

16,377. You have recommended that the goods rates should be exhibited at the stations. Is anything of the same kind required as to passenger fares ?—I believe that some railway companies do adopt that plan, and that they hang up in their booking offices the number of places to which they book, and the fares are also set out. I think that is a very serviceable thing, and, as compared with goods, it is an extremely easy thing to do, because there are so few of them. I think it would be a very considerable benefit to the passengers, and that it would not be very difficult to carry out.

16,378. You are of opinion that other companies, such as canal companies and shipping companies, should also be required to publish their charges ?—Yes ; because I think it would be unjust to railway companies if the other companies were not also required to do so.

16,379. Are not shipping companies in a position different from railway companies ; that is, that they have not received any special privileges from Parliament ?—But in this case I take it that there have been no special privileges given to the railway com-

panies. These railway companies are competing, and really they are competing at a disadvantage with the steamboat companies, and therefore anything that you have given to railway companies in this particular case I do not think appears.

16,380. Shipping companies may establish themselves without asking the leave of anybody, but railway companies must go to Parliament?—Yes, that is true, and therefore the steamboat companies would have a very great advantage, because they can establish themselves without going to Parliament, and thereby saving expense.

16,381. (*Mr. Horsfall.*) Are you speaking now of the shipping from the various parts?—Yes, of the large shipping companies that carry goods in competition with railway companies. I say distinctly that railway companies have to compete with the steamboat companies, and if you cannot get steamboat companies to adopt rates and publish them to the public, you cannot, as it seems to me, in justice to railway companies, expect them to do the same thing. Their rates must fluctuate with the rates of the steamboat companies whenever they compete for the coasting trade.

16,382. Speaking generally of the coasting trade only?—No; I refer to the interior also; the water carriage by canals.

16,383. (*Chairman.*) I believe through booking arrangements are now carried on to a great extent between different railway companies?—Yes.

16,384. Are they carried on as far as you think is desirable?—I think they are extending. I have had considerable experience in negociating for and arranging through rates, and I have never found much difficulty in arranging them. Occasionally some company may have objected to through rates on the plea that their share of the mileage division was too little, and they have advanced claims on some ground or other to an exceptional proportion, but such cases are very rare. I believe there is but little difficulty in establishing through rates between railway companies throughout the kingdom.

16,385. Do you think that in some cases it is fair that a company with only a short mileage should have a larger proportion of the gross toll than its mileage would justify?—Yes. I have found cases where it would be only fair. Take this case, of two or three miles coming on to a junction, and then off again at a junction two or three miles off, they have to shunt the goods at each end, and I think it is only fair that they should get in such a case a little more than their proportion of the mere mileage.

16,386. Are most of the large companies inclined now to enter into arrangements for through booking with one another?—Yes, they are, and have been within the last few years. Under the Great Western Amalgamation Act there were powers given, what are called compensatory powers of arrangement, which have been carried out very beneficially indeed to the public; it is a sort of give-and-take policy between companies. I will take, as an example, the London and North-western and the Great Western Companies. By an arrangement they were enabled to exchange in a variety of ways traffic at various points, and from what I have seen of it I consider that it is a very beneficial thing, especially for the public. I will give you an instance of how it works between two companies, which will probably show you the character of the arrangement. The London and North-western Company carry between South Wales and the Birmingham district. Their route is by way of Hereford and Shrewsbury, and is circuitous, and many miles longer than the route of the Great Western between the same districts. The rates for that character of traffic are low, but still the traffic is very large and valuable to both companies. Under the agreement carried out by the Act of Parliament which I have mentioned the London and North-western Company are enabled to exchange their roundabout and expensively-worked route for a shorter and more convenient one by way of Tenbury and Kidderminster over the Great Western system. This agreement enables the London and North-western Company to compete more successfully for traffic to Wolverhampton, Birmingham, London, and other places common to both systems, and is so far an advantage gained by one company over the other; and it gives a further advantage to the London and North-western Company in enabling them to work more expeditiously and cheaply the traffic from and to their own uncompetitive stations and South Wales. The advantage thus given is reciprocated by the London and North-western Company, who enable the Great Western to dispense with their equally incovenient and lengthy route from Wolverhampton, Birmingham, Oxford, and London to Manchester *viâ* Chester and Warrington, and adopt a much more convenient and economical one by way of Crewe. I do not know exactly how the accounts balance, and I do not think they will ever know it in any arrangements of that kind; but I know that it has been an immense advantage to the public, and I do not believe it has been a loss to the railway companies. I think it must be a gain to both by carrying out such an arrangement, for the consequence is, that as between those two companies they have established points of junction which they never had before; there is one at Oxford and one at Leamington for the exchange of traffic between them. If that principle can be carried out, where one company can make a compensatory arrangement with another, it must be an advantage not only to their systems, but to the public to use the lines.

16,387. As far as these particular arrangements are concerned, have the companies given each other mutual running powers over certain portions of the line?—Yes; it does not exactly amount that, although it does in some places; in the main it does not come to that. They give what they call facilities, and they give what they call contingent running powers; that is to say, if the traffic is not worked as well as the company could work it, then they go to an arbitrator, and if he decides that it is not so worked, then they have running powers. It is always advantageous for a company to keep the working of their own line in their own hands rather than have two or three doing its work; that is, if they can manage it. If the one working used its power for the purpose of preventing the traffic of the other company from having fair play, they would go before an arbitrator and get actual running powers.

16,388. (*Capt. Galton.*) What you mean is, that the London and North-western Company would take on the traffic that was to go to Manchester from Crewe?—Yes, running the trains themselves; that is to say, running a train through, not in any connexion with their own trains, but running a train through, simply employing an engine for it, and so the other running between South Wales, by way of Kidderminster and Stourbridge, both of them have these contingent running powers which I have mentioned.

16,389. (*Mr. Horsfall.*) Is the same system being adopted upon other railways?—I am afraid not. An arrangement of that kind is very easily adjusted with a company that has something to give as well as to take; but the great difficulty is of course with those lines which have been sanctioned, and which are competitive with others, and which have nothing to give for any advantage they may gain in through booking. I will just instance the case of the Great Western line from London to Cheltenham by way of Swindon and Oxford. There is a line which is sanctioned from Oxford by way of Bourton-on-the-Water to Cheltenham, and it is narrow gauge. The broad gauge is by way of Swindon, and there is a line that stops at Oxford called the Whitley railway, and attached to that is the line of the East Gloucestershire Company, which goes to Cheltenham. You may say that there is a line antagonistic to the Great Western between Oxford and Cheltenham, and that they have running powers into Oxford. If the East Gloucestershire Company, so constituted, ask the Great Western Company to book through to Cheltenham with them from their stations it is evident that every passenger or every ton of goods that there is

Mr. A. C. Sherriff, M.P.

24 April 1866.

booked through is a dead loss to the Great Western Company, as it will be simply confiscating their own line from Oxford to Cheltenham. If the East Gloucestershire line had anything to give in return to the Great Western Company, I see no difficulty in carrying out an arrangement by which both should book through from Cheltenham to all those places; but there is a difficulty, as between such lines, when either of them, either by design or otherwise, acts as a competitor for the traffic of the established railway; and I think it would be very unjust to say to the Great Western Company, you, who have laid out a large sum of money in making a line between these two points, shall immediately book through with a company who have nothing to give you in return, but who must abstract all they get from your system. I hardly know how we are to meet a case of that kind without doing grea injustice to one of the parties.

16,390. (*Earl of Belmore.*) I suppose that these compensatory arrangements between the North-western and the Great Western Companies are the results of the schedules contained in the Amalgamation Act?—Exactly so.

16,391. (*Chairman.*) You do not think it would be desirable for Parliament to introduce any new regulations which should be compulsory upon railway companies with regard to through booking?—Through booking upon railways cannot take place without through arrangements; and I am much afraid that if Parliament, or any other tribunal, were to interfere with the arrangements at junctions, and with the running of trains, they would most materially reduce the responsibility of the railway companies to the public, and by so doing they would inflict a very great hardship upon them without any corresponding benefit. After all, taking the case that I have mentioned, what very great hardship is there in a man continuing in his carriage, or a ton of goods in its waggon, between two points? There is no great public advantage to be gained by changing the traffic to another line; but there is nothing so common as this, that those who get up new railways contrive to enlist the public sympathy with them, and make public cause of what is simply a quarrel between the railway companies. It is no benefit to the public that any one should get out of one train at Oxford and get into the other; and I think it will be found that these local railways cannot afford to run express trains for the benefit of the towns in their route to the same extent as a large company like the Great Western can.

16,392. (*Mr. Glyn.*) Is there not a certain quantity of local traffic that must be served?—Yes, there is; and there is no difficulty whatever at any station on that same East Gloucestershire line in having fair through rates to all places; where no competition comes in no difficulty could arise.

16,393. (*Capt. Galton.*) It would only be for the through traffic from Cheltenham?—Yes; and I do not say even that that is not capable of solution fairly if both parties are reasonable. They might give up some portion of the mileage; or an arrangement might be made by which the traffic could be booked in both cases, but it is not so easy of arrangement as in the case of two large systems, which can afford to give and take in that way.

16,394. (*Mr. Horsfall.*) Do you think that through rates would enable railway companies to reduce their rates for the carriage of goods, or the passenger fares?—I think not, because if there are two routes between the places, the shortest mileage is always the rule; if the more convenient route is 20 miles shorter than the longer one, and you are charging your maximum, then you charge the short route and not the long one.

16,395. (*Mr. Glyn.*) Is the East Gloucestershire line made?—No, but it is sanctioned. I believe it is begun. I have merely instanced that as one that struck me.

16,396. (*Chairman.*) You think, as a general rule, that upon competitive lines they have seldom any compensating advantages to offer in return for the advantages they ask for?—I think that a great many of them have not. A great many of these lines are got up in a certain way for a certain purpose; the more mischievous they are the better, the more likely they are to be taken up by the companies around them. If they touch upon one company, and touch upon another, they afford the means to one company of inflicting an injury upon its neighbour, and their price is enhanced accordingly. I do not believe that many of them are taken up purely for the convenience of the district. There is a difficulty in dealing with these, but hitherto they have been dealt with by amalgamation and leasing; but all that kind of thing has its limits, and nowadays they cost so much money, from the peculiar way in which they are got up, as to put it out of the power of the old railway companies, even if they were inclined to deal with them, to do so, in any way in which their capital may properly come in. I know of one railway in my locality which ought to have been made easily for 10,000*l.* a mile, but it has cost between 30,000*l.* and 40,000*l.* a mile.

16,397. It has really cost that sum?—I do not know that positively, but there are shares, and debentures, and Lloyd's bonds, and all sorts of things of that kind, which raise their capital up to what I have stated, between 30,000*l.* and 40,000*l.* a mile; an excellent profit could have been made out of it by constructing it for 10,000*l.* a mile.

16,398. (*Capt. Galton.*) When you were connected with the West Midland Company, I believe that line was made by the company itself from Honeybourne to Stratford?—Yes.

16,399. Do you know what it cost per mile?—About 5,000*l.* a mile, or a little over.

16,400. That is very much like many of the lines one sees, the cost of which comes to 12,000*l.* or 14,000*l.* a mile?—Yes; we made the line, we had no contractor but our own officers, and it cost between 5,000*l.* and 6,000*l.* a mile; but I am sure that if it had been in such hands as I have described it would have cost quite the money you speak of.

16,401. (*Mr. Horsfall.*) Is it a single line?—Yes, it is in that case. The first thing is in these cases that the contractor is to take all the shares, and the contractor puts down the shares, not quite as the whole, but I take it that in fact his object is that the debenture debt, and as many Lloyd's bonds as they can get, will pay for the line. I see how difficult it would be to deal with lines got up in that way hereafter by the companies near them, because their capital stands in the way. In the case that I speak of there is an arrangement going on by which the debenture holders will take a smaller amount for their Lloyd's bonds, and they will take a smaller amount still for the shares; they are not altogether valueless. I think that arrangements between companies might be much facilitated, however, if there was some sort of tribunal within themselves which could take up the practical difficulties which sometimes are very properly urged as to working at stations, as to trains meeting, and a variety of other things, which only practical men can take up. If they had a tribunal amongst themselves, and there is one which I think might be made available for the purpose, and that is the railway clearing house, I think in many cases the interchange of traffic would be greatly facilitated.

16,402. (*Mr. Glyn.*) What powers would you give to the railway clearing house?—I really am not prepared to say what power, except that I would make this a rule, that any one joining and taking the advantages which the railway system affords through the clearing house should be amenable to the regulations of the clearing house as to traffic.

16,403. Are you aware that the present powers of the clearing house are very limited?—I know that its powers are very limited, but I think they might be made larger to the public advantage.

16,404. (*Capt. Galton,*) Would you enable them to arbitrate between companies upon questions relating to the interchange of traffic?—Yes, upon questions of interchange and working; in other words, their re-

sponsibility to the public should not be lessened by their hanging a peg of responsibility upon any outside tribunal, which would enable them to say that this accident or that arose from circumstances beyond their control. But it should be done within themselves, and I believe it would be a very considerable advantage to all the railway companies to have such a tribunal to go to easily.

16,405. (*Mr. Glyn.*) Are you aware that in some cases they have acted as arbitrators amongst themselves by consent?—I was not aware of that, but I am glad to hear it is the case.

16,406. (*Chairman.*) Do you contemplate that there should be an Act of Parliament conferring certain powers of arbitration on the clearing house?—Yes.

16,407. (*Capt. Galton.*) And that it should exist under the powers of an Act of Parliament?—Yes; to do certain things, for their powers are exceedingly meagre.

16,408. Do you think there would be any jealousy on the part of the railway companies in such a case?—I do not know; but I should think there are many companies who would view it with considerable jealousy.

16,409. Do you think it would be a fair tribunal as regards the interests of the railway companies, or unless some modification was made?—I think some modification, perhaps, would be required for the election of delegates, for at the present time I believe that a line only 10 miles in length has about the same power as a line 1,000 miles in length.

16,410. In fact there should be rather a committee chosen from the clearing house?—Yes; no doubt that would be a practicable plan of working it out.

16,411. (*Chairman.*) How is the clearing house now constituted; are the members elected by the several railway companies?—Yes; they are delegates, one from each company; but there are a variety of committees, composed of general managers, and goods managers, and passenger superintendents. The minutes of the passenger superintendents and goods managers pass through the hands of the general managers, and from them they go to the delegates, and they are passed by that body; but this refers more to matters of account than to matters of exchange.

16,412. (*Mr. Horsfall.*) Do you think that any material reduction of the passenger fares might be made with advantage to the public and to the railway companies?—I dare say in some cases it could be. The great thing that the public have to wish is that poor companies did not exist, for I believe that it is the greatest curse to any district to have a railway company that does not pay a fair dividend. I cannot imagine anything so prejudicial to the convenience of a district as that. I have had to do with poor companies, and I know the difficulty and hesitation there has been to start an extra train, or to reduce a fare or a rate for fear there should be a reduction in point of net money when you are put to it to pay your debenture debt. If anything could be done to give the companies a fair position, and to limit their numbers so that they could pay 4 or 5 per cent., I think it would be the best thing that could be done. I believe then that there would be a chance of their making the necessary experiments in the way both of additional working and a reduction of the fares and rates. I believe that this would conduce to the public convenience greatly.

16,413. (*Lord Stanley.*) You think that a company that is not doing well for itself cannot do well for the public?—Precisely.

16,414. (*Mr. Gower.*) But it may do better than no company at all?—Yes, I should not like to say otherwise, because a railway, if its fares are high, and its trains few, must of necessity be an advantage, but it would be of greatly more advantage if it were a company in itself, or if it were allied to some system by which the shareholders would receive a fair amount of interest for the money that had been laid out.

16,415. (*Chairman.*) Are the principal railway companies making experiments on a considerable scale in the reduction of rates and fares generally?—Yes; I will take the case of the North-eastern Company, with which I have had a great deal to do as a trader. They have been habitually year after year reducing their rates, as their success in a financial point of view is insured, as indeed is that of the London and North-western, and also the Great Western Company, they do as much as they can. But there is always more hesitation on the part of a company like the Great Western, who are paying only 2½ or 3 per cent., than on a railway which is paying only 5 or 6 per cent.

Mr. A. C. Sherriff, M.P.

24 April 1866.

16,416. (*Earl of Belmore.*) If any large reduction of rates is to be made, do you not think it will be safer to do it gradually than in a wholesale manner?—No doubt of it.

16,417. (*Chairman.*) Have the reductions which have been made upon the North-eastern Railway been profitable to the company?—Not for a time; I do not know enough of the matter to be justified in saying no, but I believe for a time they were not so. I have no doubt that it would require some considerable time to elapse before the same gross amount was earned as before the reduction, but the last time I spoke to their chairman upon the subject, he said they were gradually getting back to the old figure, I mean the amount earned under the high prices; but it requires a little time to do it.

16,418. Do you see any possibility of making a reduction in the cost of running trains?—No. I have mentioned one or two cases in which a reduction might be made, but I believe that with railway companies, as much time has been given to the consideration of that subject as perhaps to any other. They have introduced the burning of coal instead of coke, and in a variety of ways they have endeavoured to cheapen their cost of working. I believe it is more likely to be increased than to diminish. I believe that the more the rates go down the more relatively will the expense of working go up. I believe they have got to the limit, and that they cannot reduce materially the amount of their working expenses at the present time.

16,419. (*Mr. Glyn.*) The expenses of maintaining the permanent way are rather on the increase than otherwise, are they not?—Yes. They may lessen them by putting steel rails at the stations, but I do not anticipate that you will have the working expenses any less than they now are.

16,420. (*Chairman.*) Do you think it would be impracticable to diminish the dead weight in passenger trains, and to reduce the number of the carriages?—You would have all the public against you immediately. You will find that if there are half a dozen first-class carriages, half a dozen people will almost immediately take a place in each, and there is a great outcry if there is anything like five or six people put in.

16,421. If the public would submit to a reduction in the number of the carriages there would be a considerable reduction in the cost of them?—I think so. I think that you might run fewer carriages.

16,422. Enough to have any considerable effect upon the railway accounts?—No. I do not think so.

16,423. (*Lord Stanley.*) Is it not the fact that first-class passengers almost expect two seats instead of one?—Yes; as a rule people will not go into a first-class compartment if there are three or four people in it, if they can get into another.

16,424. (*Chairman.*) Have you any acquaintance with foreign railways?—Nothing material. I have never seen anything upon them that would make me wish to exchange our system for theirs.

16,425. I think in answer to one of the questions put to you you referred incidentally to Ireland, are you at all acquainted with the railways in Ireland?—I have been over in Ireland, and I know persons who have been engaged there. The engineer that I was last employed with on the West Midland line had been engineer of a line in Ireland, and, speaking

Mr. A. C. Sherriff, M.P.

24 April 1866.

generally, he did not seem to think that there was the same amount of energy in developing the traffic there that there is in this country.

16,426. Do you think that there is much traffic to be developed in that country?—There is not so much as there is here, but the last time I was in Ireland I was shown some specimens of ironstone which had been discovered in a district, and it was about the best I had seen for a very long time.

16,427. In what part of Ireland was that?—I think it was on the Midland Great-western line, or some line off there. I saw it laid down, and it struck me that if we had had anything of that kind in England we should have been making a great deal more of it; but still there may have been circumstances with which I was not acquainted that prevented it.

16,428. Are there any other matters upon which you think you can give the Commission any further information?—I do not know that there are.

16,429. (*Earl of Belmore.*) Do you think it possible, supposing there was to be an amalgamation in Ireland on a large scale, to put a value upon the stocks of the different companies, even of those not paying any dividend on the ordinary shares, so that they might be all cancelled or fused into one, and so to make it a fresh concern?—I think, if you selected your districts properly, it would be the very best thing that could happen to them.

16,430. Taking it from me that in one of the districts which have been proposed, there is one company, the Ulster, paying its 4 or 5 per cent., and another company paying no dividend upon its ordinary shares, and, in fact, not doing much more than paying interest on its debentures, would there be any great difficulty in putting a value upon the stock of the latter company, so as to ascertain what proportion of the new stock each of those two companies should have after the amalgamation?—I think that if an amalgamation were to take place, such as you suggest, they could do considerably more than they do now. I should not think it fair that those two companies who had shown what they could do, should be amalgamated on equal terms; but an amalgamation of some kind would benefit both.

16,431. Could their stocks have a value put upon them, or should both be cancelled and fresh stock issued, giving to each company such a proportion of shares as would be represented by what the shares are now worth?—I think there would be no difficulty whatever about it as to the proportions. If you once arrive at the relative value of the two, there is no difficulty about it—two or three shares might be fused into one.

16,432. The difficulty would be to arrive at the value of shares, which in point of fact have only a prospective value, and not a present one?—Yes; that is the difficulty; when that is solved, there is no difficulty in carrying out in practice what you have suggested.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Thursday, 26th April 1866.

PRESENT:

THE RIGHT HON. THE EARL OF BELMORE.
THE HON. E. F. LEVESON GOWER, M.P.
SIR ROWLAND HILL, K.C.B., F.R.S.
T. B. HORSFALL, ESQ., M.P.
GEORGE CARR GLYN, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
E. T. HAMILTON, ESQ., M.P.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

Mr. S. Teulon.

26 April 1866.

Mr. SEYMOUR TEULON, examined.

16,433. (*Chairman.*) You were for some time a director of the South-eastern Railway Company?—Yes, for 12 years.

16,434. While you were a director, was your attention called to the subject of rating railways?—It was, and with your permission, I will give you the result, as far as the South-eastern Railway is concerned, together with some particulars relating to other railways. I hold in my hand a list of the parishes through which the railway passes, and I have divided it, in consequence of the account being so minute, into two portions, the one containing the metropolitan parishes, and the other, the remainder of the parishes. The remainder of the parishes amount to 151 parishes, and the average of the rates upon the 151 parishes amounted, for the year ending December 1865, to 3*s.* 1*d.* and 29/100ths of a penny in the pound. I thought that that would be the better way to treat it, because an isolated parish could be no criterion.

16,435. Do you speak of the average rate in the pound?—Yes.

16,436. (*Mr. Glyn.* Are you confining yourself now to the South-eastern Railway?—Yes, I am, just at the present moment. I have had, for the sake of convenience, the account which is before me prepared. It is a statement of the amount of the parochial rates paid for one year ending the 31st of December 1865. This account will differ somewhat from the published account, because there are other rates that are not contained in this return. This return contains the whole of the poor, highway, and church rates for sundry parishes, that is, the 151 parishes, the amount being 24,502*l.* 17*s.* 11*d.*; the metropolitan parishes, 9,167*l.* 12*s.* 2*d.*; making for poor's rates, 33,670*l.* 10*s.* 1*d.* For highway rates, which I have separated, in the 151 parishes, or so many of them as appear distinctly rated, 878*l.* 17*s.* For church rates in sundry parishes—the 151, or so many of them as appear distinctly rated—I have made the amount 989*l.* 16*s.* 11*d.*, and the metropolitan parishes, 372*l.* 12*s.* 7*d.*

16,437. (*Chairman.*) Do you mean for church rates?—Yes. The total for church rates is 1,362*l.* 9*s.* 6*d.*; and these will make a grand total of 35,911*l.* 16*s.* 7*d.* for those three rates. Now I will take off from that the rates for the metropolitan parishes, 9,540*l.* 4*s.* 9*d.*, which will leave the figures I shall now deal with, 26,371*l.* 11*s.* 10*d.* The length of the railway is 319 miles, from which the following deductions will have to be made—seven miles contained in the metropolitan parishes; eight miles of the Croydon Railway, on which the rates are paid by the Croydon Company; and six miles on the South-western Railway, for which the South-eastern Company pay a toll. That will leave the number of miles included in the 151 parishes, 298 miles. The ordinary quantity of land taken for a mile of railway is 10 acres, but I find I have taken the figures out in excess. I have given 10 acres a mile for the land taken for the railway, and 120 acres for the land taken for stations. I have allowed 3,100 acres altogether. The result is this, that taking the sundry parishes, the 151, the rates are 3*s.* 1*d.* and 29/100ths of a penny in the pound, and the value of the land for agricultural purposes, would certainly not exceed 20*s.* per acre. I question myself whether it would exceed 15*s.* per acre, through

the whole length of that line; but take it at 30*s.* per acre, and instead of 3*s.* 1*d.*, to avoid fractions, take it at 4*s.* 8*d.* on the acre, the result would be, that if it had remained agricultural land, it would have paid rates, upon the same acreage as the railway has been paying, 723*l.* 6*s.* 8*d.*; in other words the railway company has been taxed for an excess of 25,648*l.* 5*s.* 2*d.* over what the land would have raised if it had remained agricultural land.

16,438. (*Capt. Galton.*) Do you mean if you take the rates at 4*s.* 8*d.* in the pound?—Yes; if the land is taken at its real value of 20*s.* per acre, but I take it at 30*s.* per acre.

16,439. You have 3,100 acres altogether?—Yes.

16,440. You have taken about 200 acres for stations?—Yes; I have taken the balance. 3,100 acres at 4*s.* 8*d.* would be 723*l.* 6*s.* 8*d.*, leaving an excess, which the railway company pays, of no less a sum than 25,648*l.* 5*s.* 2*d.* Having arrived at that conclusion, I thought the better way would then be to work it out in my own parish. I live in the parish of Limpsfield, in the county of Surrey. I live, by the road, four miles from a station, and the road is so hilly, that, although it is an exceedingly good road, it has this effect in my immediate neighbourhood, that the railway has not enhanced the value of the land, the value of the rental has grown from 10 to 12 per cent.; but that I take not to be more than the ordinary rise in the value of land, perfectly irrespective of the railway. I think I am right in coming to that conclusion, for this reason—we had a carrier from Limpsfield to London before the railway existed. That carrier has an equally good business now, and although I was connected with the South-eastern Company, I frequently employ him to fetch goods from London, because it is as cheap as the railway, or the difference of cost between tugging the things up the hills that intervene between me and the railway quite balances any difference in the freight by railway.

16,441. (*Earl of Belmore.*) How far is Limpsfield from London?—The church is 21 miles by road from London, and it would be 5¼ miles from the station.

16,442. (*Sir R. Hill.*) The carrier fetches goods all the way from London?—Yes, and delivers them to me at a little more than the railway charge; but the convenience of the thing overbalances the difference, because I should have to send to the railway station, a distance of four miles, if I sent my own cart.

16,443. (*Mr. Glyn.*) And the goods are delivered at your own house?—Yes, and the carrier fetches them from wherever he may be required in the town.

16,444. (*Capt. Galton.*) Is not the railway company charging more for the carriage of the goods than it ought to charge?—I do not know, but probably the amount of the goods that I require to be carried, not being so large as to make a special agreement, I may pay a little higher for larger quantities. The fact is borne out by the tenant of my farm, he has been there I think for 30 years. I have not thought it right to increase his rent from what it was in the first instance, and he has not thought it worth while to have a lease, although he did have one formerly.

16,445. (*Chairman.*) Has the population in the neighbourhood of Limpsfield increased?—No.

16,446. (*Mr. Horsfall.*) To what distance from the station does the railway deliver goods?—It would deliver them to me, and it does.

16,447. Then where is your difficulty?—Because the carriage by the railway and by the road costs me as much as if I employ the carrier, or nearly so, to bring the things direct from London, and there is always a convenience in this, that when goods are once shipped, whether upon a railway or any other mode of conveyance, it is better that they should be carried through to their destination without change.

16,448. (*Sir R. Hill.*) The carrier would go to any part of London?—Yes, he would fetch them from anywhere. Then I thought it would be better to try this question in another way, taking my own parish and taking the valuation of that parish to see what effect the railway had had upon it; and in the course of the inquiries which I made as to the increased value of the land, one of my neighbours said to me, "Yes, I get an increased vaule for my farm, but I "question whether it is much more than I get by the "railway reducing the rates." I have obtained a valuation of the parish; it is a recent valuation under the new Act, and the result is this:—The gross value of the houses, for I had them separated, is 2,290*l.*; the rateable value is 1,848*l.*; the acreage occupied by those houses is about 186 acres; the gross value of the farms is 2,663*l.*, which would work out to 14*s.* 4*d.* per acre. I should say that the acreage is 3,711 acres, and that amount would work out to 14*s.* 4*d.* as the gross value of the land in Limpsfield parish. The net value is 2,302*l.*, which gives 12*s.* 4*d.* as the net rateable value. The railway in that parish is valued at the gross value of 750*l.*, the rateable value is 603*l.* 2*s.* 6*d.*, and the acreage is 7 acres 3 quarters and 32 perches, a little under 8 acres. The net value at which that is rated would be 75*l.* 7*s.* 6*d.* per acre.

16,449. (*Earl of Belmore.*) For the year?—Yes, as against 12*s.* 4*d.* There is this peculiarity in the railway in Limpsfield parish, it goes through some very indifferent land, which, I think, at the time when the railway was made, would not have fetched 12*s.* an acre, but now it would fetch probably from 15*s.* to 20*s.* an acre. In the intermediate distance between the stations I think 15*s.* is the actual rent paid. The result is this, and it rather startled me. The poor's rate that I have paid for the years 1865–66, ending in March, was 3*s.* 6*d.* in the pound, and that, upon 5,261 acres, would produce 920*l.* 13*s.* 6*d.* The railway, if valued as land, at 8 acres, getting rid of the fractions, would be 8*l.*, and if you take it at 20*s.* an acre, and take the 8*l.* from 603*l.*, 595*l.* would remain to be deducted from the valuation of the parish; and the result is this, that 4*s.* in the pound would produce 933*l.* 4*s.*, the rate to be raised being 920*l.*, and 3*s.* 11½*d.* which is the nearest to it, would raise 923*l.* 9*s.* 7*d.*, that is, every acre of land in Limpsfield is benefited to the amount of 2¼ per cent., and I should pay 2¼ per cent., or 2*l.* 5*s.*, upon every 100*l.* that I received as rent, or the tenant, more than I now pay.

16,450. (*Capt. Galton.*) The fact is, is it not, that the railway company is treated just as any large works would be treated?—No, they are not so treated; I do not think you can tell me of any works that are treated in that way.

16,451. Suppose there was in a parish large steam engine works, would not those works be rated upon the profits they made?—Certainly not.

16,452. (*Sir R. Hill.*) That is the grievance, that the railways are rated upon their profits, and that other works are not rated upon their profits?—Yes. I will, if you please, go to the case of the carrier. He pays for his house and his stable—what his house would let at, and what his stable would let at; whether he makes 500*l.* a year or 5*s.* is never taken into account, and yet in my case the carrier is a competitor with the railway.

16,453. (*Mr. Glyn.*) Has the South-eastern Company appealed at any time against this rating?—They have occasionally.

16,454. Have they appealed to the quarter sessions?—Yes; they have frequently.

16,455. Have they gone to the higher courts?—I do not know that they have gone to the higher courts.

16,456. They have never carried an appeal to one of the superior courts?—No; it is a very expensive process; and also the maintenance of a staff for looking after the railway, for there is a staff maintained, I believe, by all railway companies of any extent for that express purpose; at all events it is so with the South-eastern Company, with the South-western Company, and with the Brighton Company. I will just mention a circumstance as to rating that took

Mr. S. Teulon.
26 April 1866.

place last November. Being treasurer of the Society of Arts, I was detained in town upon the occasion I refer to, and upon arriving at the Edenbridge station I met a gentleman who had been waiting there some hours for me. It is very seldom that I go by so late a train, and he said to me, "I have come to tell you "that the South-eastern Company is greatly robbed." I was afraid that there had been some defalcation at the station; but he said, "You have to pay church "rates." I said in reply, "I suppose we have." He said, "But do you know that we make and raise a "church rate, and that the South-eastern Company "pay it; and that when the money is spent we make "another—we do not get the rates from other par-"ties?" I said, "I think there must be some mis-"take in this." He said, "If you doubt me, look "here," and he pulled a piece of paper out of his pocket with this upon it:—"Church rates, so much "in the pound; arrears, so much." He said, "I "do not pay any arrears, and I don't intend to do so; "and I think it is a shame that the railway company "should pay them." On the following day by chance a cheque came before me for signature for the South-eastern Railway Company, for these church rates of Edenbridge parish. I turned it down, and I directed an inquiry to be made, and the result of the inquiry was this, that the church rate to be raised was only 65*l.* Over 28*l.* were either excused or not collected; and of the balance of 16*l.* 1*s.* 9*d.* was the demand on the South-eastern Company. It was not quite so bad, but it was something like 50 per cent. of the residue which they called upon the South-eastern Railway Company to pay.

16,457. (*Sir R. Hill.*) What is the length of the line at that part which passes through the parish of Edenbridge?—Under three miles.

16,458. (*Mr. Glyn.*) Are you aware of the principle which the superior courts have laid down as to rating railways?—I am not; but I believe it is pretty much of this kind, that certain deductions shall be made for the maintenance of the line and stations and working expenses, and then upon the balance the rating is effected at so much per mile.

16,459. Upon the balance of what?—Of the traffic passing through the place. In my own parish there is no station; the company has no cottage, and they neither take up passengers nor put down any upon the line, and yet it contributes 2¼ per cent. of the rating.

16,460. (*Earl of Belmore.*) Although the railway passes through your parish, you do not mean to state that the station which is five miles distant from the parish church is in your parish?—The station is not in the parish, it is in Edenbridge parish; there is no station and no cottage in my parish. I may mention, in connexion with this, two cases which probably have been mentioned before. We pass through the parish of Coulesden, just beyond Croydon, and on the other side of Merstham tunnel we pass through the little station of Merstham. Coulesden parish is rated, I think, at 3,150*l.* per mile for the land, which certainly at one time would not have been worth 12*s.* an acre.

16,461. (*Sir R. Hill.*) Do you mean rated upon a rental of 3,150*l.*?—Yes, per mile. I could have spoken a few years since confidently upon it, but there has been a small branch made which goes partly through the parish of Caterham, which has added to the amount of the rates. I cannot separate them, but on this part of it the company have no station. The only house they had in the parish of Coulesden was a small house at the top of an embankment for the signal man to be in; that was all. The rates from September of last year to March of this year were 429*l.* 4*s.* 10*d.* for each half-year, making together 858*l.* 9*s.* 8*d.*

16,462. (*Mr. Glyn.*) For how many miles of railway through the parish?—I do not know; I think not two miles. As the rateable value, as I find on my memorandum is 5,726*l.*, it would be under two miles. I should add that in this particular instance, as well as in the next, the rating includes the whole of the Brighton traffic as well as that of the South-eastern Company under the arrangement that I spoke of in the Merstham parish.

16,463. Is that the adjoining parish?—Yes; it is on the other side of the tunnel. In Merstham parish the company is rated to 12,663*l.*, which, at 1*s.*, gives 1,266*l.* for the year as the rates paid. If the land where it is not used for stations was rated as land,—make it if you please some fair advance upon the value of the land as agricultural land, the parish would have a benefit by it,—let the stations be rated in the same manner as carriers and other parties would be rated for their houses and warehouses.

16,464. Has not the South-eastern Company appealed upon these rates?—Yes, frequently; but the principle, I think, is admitted of rating them upon the traffic passing through the place.

16,465. That has been decided by the superior courts?—Yes; I take that to be the law.

16,466. (*Chairman.*) Do you say that it would be just that railway companies should be rated only for the value of the land they occupy?—Yes, and I think there is a precedent for taking it in that way; it would be this; a clause or rather clauses are very common in all Acts of Parliament, and they exist in those of the South-eastern Company and the Brighton Company and others, to this effect. I have two of them here; they are rather verbose, but the effect is this, that wherever a company takes in land, or a house, or a stable, or any premises whatever, that they shall pay upon the rates that such premises or such land would have paid until the railway was made. The parishes therefore lose nothing, they are fixed at the old amount, and I cannot see at all why it should not in some manner be carried out. I think there should be some clause enacting in what manner the rates should be made; it is certainly most desirable, and I would rather carry the mails free, and let them go by every train that goes out of London, than that this continued question of rating, and the expenses attending it, should be raised. The carriage of the mails upon the South-eastern line would cost considerably less than the amount of the excess of rates paid.

14,467. (*Earl of Belmore.*) How long is it since the law was laid down as you have described it?—I cannot say.

14,468. (*Sir R. Hill.*) It has not been decided by statute law, I believe?—No, it has arisen by custom.

14,469. (*Capt. Galton.*) Is not the principle of rating assumed by the judges to be the same principle as that upon which other undertakings in which money is earned are rated, and is not the rating really fixed by what the railway would let for, if it were let to some individual?—Probably it may be so, but I think it may be impossible for application in that way. I do not think it would be a fair thing, taking it as a whole, as in the case of Limpsfield parish, we have taken a piece of land which is of very little value so far as to its being land taken from agricultural purposes, it is scarcely worth anything; it is the surface of the railway, and the banks still produce grass as much as they did before, and probably more.

16,470. Is not the principle upon which railways are rated assumed by the law courts to be the same principle as that upon which other descriptions of property are rated; and if so, and railways are to be exempted from it, would it not be making a new law for them?—I will give you, if you please, the instance of the carrier. He has his income, which is derived from the different parishes and places through which he passes between Limpsfield and London, he is not rated upon his traffic, or upon what his business might let at, but for the place he occupies.

16,471. Do you think that that is a case in point?—Yes, I think it is.

16,472. Is it not like a dock, which may extend into several parishes being all part of the same works, and is it not therefore, looked upon as a whole by the judges?—It may be so, but I do not think it is fair to do so.

16,473. (*Mr. Horsfall.*) On that principle the railway company which did not pay any dividend could not be rated ?—I do not know an instance in which land is not rated, but I do know an instance where a line does not pay.

16,474. Going upon the principle that has been laid down, it would imply that a railway company ought not to be subjected to rates ?—It might be so, but I do not know of any instance where land has been rated at less, even where a railway does not pay the smallest amount. I know of none, and part of the line is something like 50*l.* a mile, which would be still much higher than the land would be rated at for agricultural land.

16,475. (*Sir R. Hill.*) Your complaint is this, that railway companies are rated upon their ascertained profits. Is not that so ?—Yes.

16,476. If a person takes a warehouse to carry on his business he is not rated upon his profits ?—Not at all.

16,477. He is rated upon the estimated rent of his warehouse ?—Yes.

16,478. A railway company is rated upon its profits, and is not the mode of rating this, that the total profits of the line having been ascertained, it is assumed that every mile of the line affords a proportionate profit, and that if it passes through a given parish the estimated profit in that parish is determined by the length of the line in the parish as compared with the total length ?—It is, as far as they can ascertain, the amount of profit earned on the traffic passing over the line.

16,479. In the parishes of which you have spoken, does your railway add at all to the expenses or to the rates of the parish ?—Not in any way.

16,480. To the cost of the poor ?—Not in any way, but on the contrary ; being great employers of labour they have rather relieved the poor's rate in my own parish, and I know that it has extended to a considerable area round me. We are now paying 15*s.* for labourers, and before the railway was constructed there we paid 10*s.*

16,481. The effect of making a railway in a rural parish has frequently been to reduce the cost of the paupers in the parish, has it not ?—It has.

16,482. It has further enhanced the value of a great part, and perhaps the whole of the land in the parish, and in that way it has in effect reduced the rates upon such land ?—It has reduced the rates in the pound.

16,483. Nevertheless the company has been required to pay a very large proportion of the total rating—in some parishes I think as much as a half of the total rating—in consequence of the line passing through a parish ?—I cannot speak to that.

16,484. You have told us that the South-eastern Company has to pay a very large part of the total receipts of the parish in which you live ?—Yes. In the case of Coulesden, I believe the company pay more than two-thirds of the rates, and in Merstham they pay more than three-fourths.

16,485. Such being the case, whatever may be the technical mode by which the amount of the rates to be paid by the company is determined, you think that practical injustice is done to the railway company ?—There is no doubt of it, and I will give you an instance as to the increased value of land by railways passing through the property. In the last session a bill was passed for enabling the Brighton Company to make a line from near Croydon to Groombridge. The Goldsmiths' Company held a large amount of land in that neighbourhood ; the value of the land there certainly did not exceed 20*s.* an acre, and a great deal of it was of much less value. The line is not made, but I heard this morning of a gentleman having let 35 acres of land on a building lease at 3*l.* 10*s.* per acre in anticipation of the railway being made ; that is 350 per cent. advance already.

16,486. (*Mr. Glyn.*) Was that land adjoining the station ?—It was within half a mile of it. The same thing takes place almost everywhere as to the increased value of land within a reasonable distance of a station. At Reigate there was a large estate called the Ray Park estate, and it sold, I think, probably at about 35*l.* an acre, but the last sales of land upon that estate have been at 1,000*l.* an acre ; the value has gone up gradually from 35*l.* There is another line running out of the South-eastern, called Caterham line, and that line was made for the purpose of letting the land to builders, and without letting the land as building land it was of very little value as agricultural land, but from about 25*l.* or 20*l.* an acre it has grown up, and I believe the price is now 400*l.* an acre.

16,487. (*Sir R. Hill.*) Was that an extensive district ?—Yes ; it was considerable as to extent, and the parties thought it worth their while to make the Caterham branch, which cost 42,000*l.* The South-eastern Company afterwards purchased it for 16,000*l.* from those who made it.

16,488. (*Earl of Belmore.*) Do you know how much the company that made the Caterham branch paid for the land which they took for their works ?—No, I do not, but I think they came into it unusually cheap ; the land owners along there were so anxious to get a line made that I believe the company bought the land on very good terms.

16,489. (*Mr. Glyn.*) Have you been able to make any comparison between the rating on the South-eastern line with the rating upon other large lines of railway out of London ?—I have prepared a statement containing all the lines out of London, but first I have a very good return from the Brighton Company which they have had made out for me, and which I will put in, "London, Brighton, and South Coast Railway : " Return showing the number of parishes, with the " amount paid for poor rates in the year 1865, " together with the average rate in the pound." The number of parishes is 157, which are beyond three miles from Victoria station or London bridge. The amount of rates paid was 19,653*l.* 3*s.* 6*d.* This is for poor's rate only, the average of which would be 2*s.* 4*d.*, they are better off than the South-eastern. The next is a return showing the number of parishes, with the amount paid for highway rates in the year 1865, together with the average rate in the pound, excluding the parishes within three miles of London Bridge or Victoria stations. There are 87 parishes, and the amount paid is 1,737*l.* 5*s.* 9*d.* The average rate is 6½*d.* in the pound. To this there is this note : Our payments under the head of highway rates have been much reduced, owing to the expenses of repairs being paid in some parishes out of the poor rates, by virtue of the new Highway Act, 25 & 26 Vict. cap. 81. Then there is a similar return for church rates, 78 parishes, the amount is 768*l.* 14*s.* 10*d.* or 2¾*d.*, in the pound. Then I have taken from the published statements of the different companies this :—" London, Brighton, " and South Coast, six months ending 30th June " 1865, 14,092*l.* ; six months ending 31st December " 1865, 19,481*l.* 2*s.* 7*d.*," and the result of that would be 33,573*l.* 2*s.* 7*d.* for rates and taxes. " London, " Chatham, and Dover, six months ending 30th June " 1865, 6,350*l.* 7*s.* 2*d.*; six months ending 31st De- " cember 1865, 6,609*l.* 0*s.* 1*d.*," making together " 12,595*l.* 8*s.* 2*d.*" for rates and taxes. " London " and North-western, six months ending 30th June " 1865, 44,501*l.* 14*s.* 7*d.* ; six months ending 31st " December 1865, 41,327*l.* 10*s.* 7*d.*," making together " 85,829*l.* 5*s.* 2*d.*" for rates and taxes. " Great " Eastern, six months ending 30th June 1865, " 16,727*l.* 8*s.* 6*d.*; six months ending 31st December " 1865,18,325*l.*19*s.*," making together "35,053*l.*7*s.*6*d.*" for rates and taxes. The Great Northern accounts include, differently from any of the others, the costs of appeals, and the total for the two half-years is 31,303*l.* 0*s.* 3*d.* Midland, the total is 44,670*l.* 15*s.* ; South-eastern, deducting tolls that were included in their account, 54,084*l.* 4*s.* ; Blackwall, for the half-year ending 30th June 1865, for the following half-year is included in the Great Eastern accounts, 1,704*l.* 7*s.* 8*d.*,

Mr. S. Teulon.

26 April 1866.

making for rates and taxes on these railways, having their termini in London, no less a sum than 299,177*l.* 10*s.* 9*d.* The South-western railway printed accounts, showing rates, taxes, and Government duty, in one amount, is not included.

16,490. (*Sir R. Hill.*) You have spoken of taxes, but does the statement include the passenger duty?—No; I have had that separated; that is not so much as the taxation, but it is 225,266*l.* 15*s.*

16,491. (*Mr. Glyn.*) You have not divided it to show how it bears upon each mile of the line?—No, not the mileage, and that brings me to another point. I think it is very desirable that all railway accounts should be published in the same form; it is desirable for the railways themselves, for there are certain matters in railway accounts which would throw great light upon and assist them in checking the expenses if they were all in the same form. I was astonished in looking over this account, to see that the South-eastern Company, with the exception of the London and North-western Company, pay the largest amount of rates and taxes and Government duty of any line out of London, and this result I was not prepared to find. They pay 82,966*l.* 6*s.* 3*d.* rates, taxes, and Government duty; the Midland Company pay 68,404*l.* 6*s.* 3*d.*

16,492. (*Mr. Glyn.*) I understand you to say that the South-eastern Company has not appealed against any of these rates as the northern companies have. They have all appealed and obtained great deductions?—I thought you asked me whether we had carried the question of rates to the superior courts. Appeals are constantly taking place in the country in the different parishes, but they generally stop there without going any further.

16,493. You have been satisfied with their assessment?—Until the mode is altered in which we are rated, I think it is of no use to carry a case into the superior courts.

16,494. (*Capt. Galton.*) Are the railways rated in a different way from water or gas companies?—I do not know much about those companies. The rates paid by gas and water companies to the parishes through which they pass are in the nature of royalties for the use of the land of which the ownership is not in the companies.

16,495. Do you know whether in the case of turnpike road trusts, when the tolls were let, any rating was laid upon them, or is there any rating of the turnpike roads?—Not that I am aware of, but I think not. On the contrary, besides the letting of the tolls, the landholders were called upon in the shape of highway rates or statute duty frequently to assist in maintaining the roads.

16,496. (*Mr. Gower.*) Is the principle upon which railways are rated universal throughout the country?—I apprehend so, I am not aware of any difference.

16,497. Have they been always rated upon the same principle?—That I cannot say.

16,498. You are not aware of any change in the law?—During the time that I was a director of the South-eastern Company they were rated upon the same principle.

16,499. (*Chairman.*) The general principle on which all properties are assessed is the value that they may be supposed to be worth for letting?—Yes.

16,500. And that, in the case of railways, might leave a very wide margin for different judgments to be formed?—No doubt.

16,501. There are, in fact, no data to go upon?—I cannot say that.

16,502. Have any of the railways ever been let?—Yes, railways have been let. They have these data to go upon, that is to say, they make out their valuations upon the amount earned by the railway company as it appears in the published accounts of the railway.

16,503. Do the parochial authorities consider that they have a right to take into account the value of the rolling stock, or merely the value of the line itself, and the rails upon it for letting purposes?—I apprehend that their mode of dealing with the rates is this; they make a deduction from the earnings for the rolling stock and its maintenance, and another deduction for the maintenance of the road, and some other minor deductions, and the residue they would deal with as the rateable amount. I think that is the mode of doing it.

16,504. (*Mr. Gower.*) As far as you are aware railways have been made with a full knowledge of the principles of rating to which they would be liable?—I should say certainly not, in the case of the South-eastern railway, because it was made before that question had come into operation.

16,505. (*Mr. Horsfall.*) Have you considered the principle upon which the present system of which you complain could be improved?—I should propose that the land, where it was agricultural land and would remain so, were it not for a railway being made, should be rated still as agricultural land, and that an amount should be added to that, either of 50 or 100 per cent., and give it a superior value for that purpose. I would have all the stations rated as stations at what they would be let for if they were occupied for any other purpose, and give the parishes where those stations were built the benefit of it.

16,506. Upon what principle would you value those stations?—There would be first the station master's house, that would be valued as an ordinary dwelling house, at what it would let for to any other person, and sheds in the same way.

16,507. You would not consider it at all with reference to what the value of the station was to the company?—Certainly not. Messrs. Rothschilds and other merchants occasionally make enormous sums of money, and nobody ever heard of an inquiry into what the profits might be.

16,508. Except for income tax?—We pay that too.

16,509. (*Mr. Glyn.*) You would not admit or take into account the possible letting value?—It is a fictitious value, not a real value, not a letting value. You might get another company having the necessary capital and all the appliances to take it, but I think the other is the fair and proper mode. No railway passes through a district, however remotely, but what some part of it is greatly benefited, and I do think it is not right, although I am benefited by the taxation of the railway individually as a landholder, that the railway should be taxed to pay my taxes, and to relieve me.

16,510. (*Sir R. Hill.*) Within the last eight or ten years the dividends upon some lines of railway have fallen considerably, have they not?—In the South-eastern Company they have fallen in the last two years.

16,511. Has your rating been diminished with the fall in the dividends?—I am afraid not; we should have to appeal in every case to bring it down, but then they would go up, we should hope, in a better year.

16,512. (*Capt. Galton.*) If an alteration were made in the system of rating, should you be prepared to recommend that the company should give up any of its powers, in consequence of the exemption it would acquire, by reducing its fares or in some other way; for if an alteration took place now in the system of rating, it would have the effect of putting so much money into the pockets of the shareholders?—Yes, and that would be in the case of the South-eastern Company, 6*s.* upon 100*l.* worth of stock.

16,513. (*Sir R. Hill.*) If you were relieved from rates and taxes it would add 6*s.* per annum upon 100*l.*?—Yes, it would add that to the dividend.

16,514. (*Capt. Galton.*) In return, should you propose to benefit the inhabitants of the parishes in any way by a reduction of fares?—That would be a matter for consideration; no doubt the company would be in a better situation if they had less to pay; but in the case of my parish, to refer to that again, we take up no passengers and put down none; we have no one of the company's servants residing in the parish.

16,515. (*Sir R. Hill.*) There is no station?—No.

16,516. (*Chairman.*) The appeals which have been made by the different companies have always been with the view of getting a certain amount of reduction, never on the principle that you advocate—that a line ought merely to be rated at its agricultural value?—Never, that I am aware of.

16,517. (*Sir R. Hill.*) That is to say, not recently?—No.

16,518. You are not, I suppose, prepared to say that in the early history of railways, appeals were not made against the principle of rating?—No; I guarded myself expressly against that.

16,519. (*Mr. Gower.*) Has the fact that railway companies pay so large a proportion of the rates, led, in your opinion, to extravagance in the administration of the rates?—I should think not. The only case that I know of was the church rate case which I have mentioned, and that is not a solitary instance as to church rates.

16,520. (*Earl of Belmore.*) I suppose the effect of the case you mentioned would be that very often a larger church rate would be struck than otherwise would be necessary, in order that the railway company should pay a larger proportion?—I cannot say that; they obtain the railway company's cheque with great punctuality, and they do not get the other, and it is quite sufficient.

16,521. (*Chairman.*) Is this a grievance on the part of the railway companies exclusively, or are there any other descriptions of property that are affected unjustly?—I am not aware of any that are affected in the same way, unless it might be in the cases of water companies and gas companies, to which Captain Galton referred.

16,522. (*Mr. Glyn.*) Do you know how the rating upon canals is carried out?—I believe that in some cases there are express clauses in the Bills to prevent this state of rating, and I think some other undertakings come under the same category as railways, but as I have not looked into any accounts I cannot speak to it.

16,523. (*Chairman.*) Has there ever been any concerted action on the part of railway companies generally to effect an alteration in the law, or do they consider the grievance so great a one that they have a right to appeal to the Legislature to have it remedied?—I believe that in the early times of railways they did feel it exceedingly, but in later times, like many other things, it has grown into a custom.

16,524. (*Mr. Glyn.*) Are you aware whether, in some of the more recent Acts, the Board of Health Acts and some others, there has been a clause introduced by which the rating upon railways is defined?—I am not aware of it.

16,525. You do not know that it is taken very much, as you have said, at the original value of the land, with a certain per-centage added to it for the purpose of rating?—I am not aware of that, but I am aware of this, that there are clauses common in all metropolitan Acts, and certainly in many others, that when land or houses of any kind are taken for the purpose of making a railway, upon notice being given, the railway immediately becomes chargeable for the rates.

16,526. You are not aware whether there is any actual limitation in those Acts as to rating on railways?—I think not.

16,527. (*Chairman.*) Have you considered the question of compensation to passengers for accidents, and whether that is on a just footing at the present time?—I think it is not on a just footing. The passengers are all taken at fixed rates, according to the tariff of the respective companies, and it appears to me to be very unjust to a company, that one person may claim many thousands more than another person who is riding in the same carriage, and under precisely the same circumstances.

16,528. (*Capt. Galton.*) You mean that the company is bound to carry both at the same fare?—Yes.

16,529. They cannot charge more for the man who can ask for thousands than for the man who can only ask for a few pounds?—No. Some arrangement has been made, I believe, in a recent Act of Parliament obtained by the London, Chatham, and Dover Company, by which a very low rate is obtained for the carriage of workpeople, and I think there is a limit of something like 50*l.* put down; and it would be, I think, quite right to have some limit, such a limit as Parliament might fix for first, second, and third class passengers.

16,530. On the same principle as the limit which is fixed in the Carriers' Act?—Yes.

16,531. Or in any traffic Act, in which a limit is put for horses and cattle?—Yes.

16,532. The Merchant Shipping Act limits the amount to be paid for compensation in case of accident?—That rather differs. The Merchant Shipping Act differs from the other two; in principle it is somewhat the same, but the Merchant Shipping Act, I believe, in certain cases, limits the amount to be paid to the value of the vessel; the division is a different matter, it depends upon the number of persons, and what freight there might be on board. I think it is right there should be a limit, it is right irrespectively of the question of compensation itself. The present mode of obtaining compensation leads to gross immorality in the class of men who are employed to obtain it. An accident happens, and there are repeated instances of passengers who have been travelling in a train, being looked-up by these persons. They say, "You were a passenger in a certain train, "I will get you compensation," and between a doctor and a lawyer, these cases are got up. I remember a case, or rather some cases of the kind, some years since where this happened. There were some 14 cases in which applications had been made for compensation, and two parties, that is, the lawyer and the doctor fell out; one of them said that he would have nothing more to do with the cases, and then the lawyer, I believe it was, was determined not to lose his fees, and 14 writs were issued against the South-eastern Company for compensation, and of course the cheapest thing for the company to do was to pay the compensation in all those cases. There was a recent case, which arose out of the terrible accident that occured at Staplehurst. I was told this by one of the stipendiary magistrates, last Friday week; he said, "You were speaking to me about the Staplehurst "accident. I had a friend in it, and your company "very liberally compensated him, as he thought, "with 300*l.*; they have paid his expenses, and he is "quite satisfied, but his attorney offered to give him "a cheque for 1,000*l.*, and run the risk of what he "could get from the company." I believe that compensations of that kind are not of unfrequent occurence.

16,533. (*Sir R. Hill.*) Do you know whether that offer was accepted?—It was not. He received the 300*l.*, and declined the offer.

16,534. (*Mr. Hamilton.*) Would not the objection you have made apply equally, whether the amount of compensation in each case was limited or not?—I think not; it would in some cases, but not generally.

16,535. In degree it might be lessened, but in principle it would be the same?—I think in the majority of cases the compensation would be paid.

16,536. The maximum amount would be paid?—Yes, in many cases, where they would ascertain distinctly, through some respectable medical man, irrespectively of the legal profession, and where they would get the best evidence, and if they were satisfied that a serious injury had been done, within a reasonable amount of compensation, they would pay it rather than contest it. In many of the modern cases, the contest between the company and the applicants has not been whether the accident has happened through the carelessness of the company or not—that has been admitted. The question has been, what should be the compensation. I remember one case, in which two commercial travellers were sitting in the same carriage, the train I believe, passed over a stone, and

Mr. S. Teulon.

26 April 1866.

they got thrown to the other side of the carriage, one of the two received 10*l.*, and thought himself very well compensated. However, as they passed on one them said to his companion, "I have long "wanted to retire from the road, and I shall now "do so." He went down to Ramsgate, and made a demand upon the company for a few hundred pounds. The company sent down, not only their own medical man, who said there was nothing in it, but they sent down an eminent London surgeon, who reported that he thought there was nothing in the accident at all, and that it was quite a got up case. It went on, a larger demand was made, and at last, after about 18 months or two years, the case was tried at Guildhall. The man came into court with a seton at the back of his neck, and he looked in a very dreadful state. The counsel, as they will sometimes do, said, "We will not give the jury any "trouble; let the surgeon (the eminent gentleman "before referred to) take this man out of the room, "and if he thinks it is a serious case, we will accept "his opinion." He went out of the court, and came back again and he was then of opinion, that this man was suffering so dreadfully, that the grave was shortly before him; and that man had a large amount given to him as compensation, and became perfectly well immediately afterwards. I forget whether it was 2,500*l.*, but it was over 2,000*l.* It was, however, so bad a case, that the man left the place where he had been living, and went to reside somewhere on the south coast, but the people in the parish finding that he was a strong man, and hearing of the case, fairly drummed him out of the parish.

16,537. (*Mr. Hamilton.*) Do you think that the seton was put in his neck for the purpose?—Yes, no doubt of it.

16,538. (*Mr. Gower.*) Your complaint in this case is not against the law but against the administration of it?—It is so far against the law that the law gives no limit.

16,539. (*Earl of Belmore.*) What sort of limit do you think would have been fair in this case?—I think that for a first-class passenger travelling a long distance upon a railway, and perhaps you would say that the limit should be the same in all Acts, it might be 1,000*l.* for a first-class passenger, 500*l.* for a second-class passenger, and 250*l.* for a third-class passenger. But I am certain that it would be cheaper for the companies to pay in many cases than to have to pay the fees for medical examinations and consultations and so on, and run the risk of juries, which is very great in cases of this kind, for they are no judges of the circumstances.

16,540. (*Capt. Galton.*) You would pay, I suppose, whatever the nature of the accident was?—I mean one affecting life.

16,541. Of course the full amount of 1,000*l.* would be paid in case of death, and the same would be payable in case of serious injury; but what I mean is this, that in whatever way the accident occurred, you would have the compensation paid, and not have the company dispute whether the accident occurred from the fault of themselves or their servants or not?—No, I would make it as simple as possible, to avoid any necessity for legal proceedings.

16,542. (*Sir R. Hill.*) You would pay the same maximum compensation to any man who rode in a first-class carriage, whether his life was a very valuable life or not?—Precisely; we are no judges. Under the Carriers' Act the companies would only have to pay a certain amount unless the parties declared for an increased value.

16,543. Is there not a rule already applied in certain cases; for example, with respect to horses, is there not a maximum to be paid if a horse is killed?—Yes, it is so.

16,544. What is that maximum?—I think it is 50*l.*

16,545. And that whether a horse is a valuable racer or not?—No; I think not.

16,546. The owner of the horse may, by insuring, obtain a right to a larger compensation?—Yes, he may.

16,547. But in the absence of any such insurance the demand upon the company is limited to 50*l.*, whatever may be the value of the horse?—The amount to be paid is 50*l.* whatever the demand may be.

16,548. The amount is limited to 50*l.*?—Yes.

16,549. (*Earl of Belmore.*) In the case of a claim being made, is it open to the company to say, the horse that has been killed is not worth 50*l.*, and so refuse to pay even to that limit?—Yes it is.

16,550. Would you apply that principle to the maximum compensation for accidents to passengers?—I would apply it in this way. If a man was killed I think the limit should be paid, but with regard to other cases, if it were for an injury, fair evidence should be given as to the nature of the injury and the compensation to be given.

16,551. (*Mr. Glyn.*) You watch these cases of compensation pretty closely, and have you not observed continually a disposition on the part of juries to go very much beyond the summing up of the judge with regard to damages?—Yes, in almost all cases.

16,552. Therefore in such a case would it not improve the present system if the question of fact only was left to the jury, and the question of compensation to some other tribunal?—I think it would. I would draw that distinction, referring to what I said, that companies would avoid, if possible, going before juries; and I also said that companies generally admit the fact of an injury arising from carelessness on the part of the company, and only contest the question of value and the nature of the injury done.

16,553. At present the assessment, unless it is agreed to between the parties, is left in the hands of the jury, who are generally influenced against the company?—Almost always.

16,554. (*Mr. Horsfall.*) Are there not cases in which parties sustain a loss but make no claim?—Many; but they are generally small injuries.

16,555. There were some instances when the Staplehurst accident occurred?—There were some, and there was one in which it commenced in that way, but it got ultimately into the hands of a professional man, and 100*l.* had been offered, and was about to be accepted, was declined, and a larger sum was afterward paid.

16,556. Was there not the case of a gentleman who lost his wife but who declined to receive any compensation?—I think that originally the case went very much in this way. I think that the gentleman had a son injured as well, and being a gentleman of very high respectability, he proposed to receive simply, I think, 100*l.* by way of not making a profit out of the misfortune of the railway, but to pay certain expenses. I think, before it was settled, other parties interfered, and a large sum was paid.

16,557. But no claim was made for the loss of his wife?—I think not; but these are rare cases.

16,558. You stated just now that the limit under the Merchant Shipping Act was confined to the value of the ship. I think it is the ship and the freight?—Yes, of the goods on board.

16,559. (*Chairman.*) Has the present state of the law any tendency to encourage additional care and caution on the part of railway companies?—I do not think so.

16,560. Do you think that there would be as much care and caution taken if the law was altered as you recommend?—Yes, entirely. Take the two great accidents which happened upon the South-eastern during the last year, as appears in the South-eastern accounts. I think that 73,000*l.* have been paid for compensation in the last twelve months, and I do not think, whatever law was passed, that you could make the railway company more particular than the South-eastern company was in both the cases I have referred to. Their provisions ought to have been sufficient to have prevented the accidents. In the first case a man made a mistake, a train was divided in the Blackheath tunnel, the duty of the signal man was perfectly clear,

that no train should enter the tunnel until the other had come out. That signal was obtained at the further end of the tunnel properly, and the man there made an inquiry whether the former train was out of the tunnel, when the signal man lost his presence of mind, and gave the signal all clear ; he was frightened when he had done it, he could have stopped the other train, but he had not the nerve, for there was another intermediate signal which he could have given. As far as the company is concerned they could have made no regulation that would have put that man's brain right for the moment.

16,561. (*Mr. Hamilton.*) You say that the company have paid excessive penalties ; has not that led to increased caution on the part of the company ?—I think there is every caution taken upon the South-eastern line that is possible with advantage to the public and to the company.

16,562. Do you think that more limited penalties would diminish the precaution that is taken ?—I do not think it would ; I think the company have so large a stake in their reputation, in their rolling stock, and in everything that appertains to public carriers, that no penalty and no alteration of the law in that way would affect the care which they take.

16,563 (*Sir R. Hill.*) Do you think that moderate penalties would produce as much effect as excessive ones ?—Quite ; and there is no instance of excessive penalties ever effecting their end under the law.

16,564. The sum paid in the shape of compensation is by no means the only loss which the company sustains in consequence of an accident ?—Certainly not.

16,565. A serious accident like the one referred to for a time checks the traffic upon the line ?—Yes, it checks it greatly, and that throws the traffic for a time on to the London and Chatham line, as it did in the case of the Staplehurst accident.

16,566. Therefore, even if there were no compensation paid the companies would still be punished for the accident by the loss of traffic and injury to their own reputation ?—No question of it, added to which there is the loss of stock, and the damage done to the line, which, in the case of the Staplehurst accident, amounted to a large sum of money.

16,567. (*Mr. Hamilton.*) That I suppose is found not to be sufficient to induce that precaution in the working of a line which the public have a right to expect, otherwise the law of compensation would not exist ?—I do not know that, for there is damage done irrespective of the question of care by the railway company to an individual if he is injured, or to his representatives if there is loss of life.

16,568. Then you would say that there are two objects in the law, one to make the railway company cautious, and the other to compensate individuals who sustain injuries ?—Yes ; but the last is the great principle.

16,569. Upon the whole, taking a survey of the accidents which have occurred in your time, is it your opinion that the compensation granted by juries in proportion to the injuries suffered by individuals, or by their families has been excessive ?—Exceedingly so.

16,570. You think that the compensation has gone beyond the injuries that were sustained ?—No doubt.

16,571. Looking at it as a whole ?—Yes, there is no question of it.

16,572. (*Capt. Galton.*) If you limited the amount of compensation to be paid in case of accident, do you consider that a company ought, if called upon by an individual, to insure his life for a greater sum upon his paying a certain price ?—Yes, there is no objection to that. I think that is quite fair. I would allow each passenger to know his own value best.

16,573. (*Chairman.*) You have stated the sums that you think it would be reasonable that a company should be liable to pay for 1st, 2d, and 3d class passengers ?—Yes ; I think it might be 1,000*l.* for a 1st class passenger, 500*l.* for a 2d class passenger, and for a 3d class passenger you might, I think, take half again, and say 250*l.* ; I should have no objection to that.

16,574. (*Sir R. Hill.*) Should not the compensation in each case be in proportion to the mileage rate ?—I think that would make it too complicated ; in justice it might be so, perhaps, but I think the simple rule is the better one. It is really a matter of little consequence, if a man loses his life, whether it is on the first mile or the last mile of any length.

16,575. But I asked whether it should not be in proportion to the mileage rate ; that is to say, if you charge 3*d.* a mile for 1st class passengers, 2*d.* for 2d class passengers, and 1*d.* for 3d class passengers, the compensation to the 2d class passenger should be two-thirds of that which was paid by the 1st class passenger, and so on ?—It would come to pretty nearly the same thing. I take it at half. I made, in the middle of last year, with reference to some of the early cases of compensation, and for the Staplehurst and Blackheath accident, two or three jottings down, and I found that the settlement of a great number of them, including costs and including medical fees, turned very frequently upon whether the injured person or his representative obtained a settlement of the fees.

16,576. Can you state how the money expended in litigation compares with that which is paid in compensation by the company ?—I could in a few cases, but not in many ; my jottings do not go to that extent. I see here one case, 180*l.*, expenses 41*l.* 10*s.* ; in another case, 197*l.*, costs 60*l.* ; and in another case of a verdict for 600*l.*, costs 131*l.* 1*s.*

16,577. Do the costs of the company include those of the passenger or the claimant ?—In some cases they may, but generally speaking they are the charges of the medical man, and for the legal assistants.

16,578. If the maximum compensation were fixed by law in the manner you propose, litigation to a great extent would become unnecessary ?—It would. I think in many cases it would be left, where there was a question, perhaps, to two respectable medical men, with permission to call in a third if it was found necessary.

16,579. (*Mr. Gower.*) In that case would not the maximum always be given ?—In many cases no doubt it would. There is another matter which I wish to mention. I think that an alteration is required in the 24th and 25th of Victoria, chapter 97, and in the 24th and 25th of Victoria, chapter 100. There are two clauses in those Acts, the 35th and 36th in the first Act, and the 33d and 34th in the other Act ; they are Criminal Consolidation Acts. There is a clause with regard to the case of injuries done by persons throwing stones at trains ; and under the alteration of the law made by those Acts, it is made felony in a child of nine or ten or eleven years of age to throw stones at a train ; it is made felony, and I think it ought to be left for the magistrates before whom the case is taken, to deal with cases of that kind, and in the event of there being graver cases, let them send them to the sessions to be dealt with ; but in the case of children of tender age, the magistrates ought to be able to deal with them. The result is that many of these cases are not proceeded with.

16,580. (*Chairman.*) Is there not a general Act referring to all offences committed by young children? —Yes ; but it does not take in these particular cases. The Criminal Consolidation Acts are of more recent date ; before they were passed, the law enabled magistrates before whom the case came, to deal with it summarily ; and there is this peculiarity in the law, that if in London or in the district of the Metropolitan Police, a boy throws a stone at a train, you can proceed against him under the Police Act, and the utmost penalty that can be inflicted is 40*s.* But if a boy, instead of being upon a bridge or upon a road, be on the railway, under a bridge, or on the slope of the railway, and throws a stone, it is felony ; and while in the one case he might have done serious

Mr. S. Teulon.
26 April 1866.

injury, in the other he may have done none. The magistrate must send that case to the sessions; he cannot deal with it.

16,581. (*Capt. Galton.*) How does that arise?—The framers of the Criminal Consolidation Acts divided persons from property, and in doing that they made this great mistake. I have had some correspondence with Sir George Grey upon the subject, for an amendment of that Act, for I think it ought not to remain as it is.

16,582. (*Sir R. Hill.*) To what distance from the line of railway do you consider a benefit is conferred upon the land and other property by the construction of a railway?—I should think from five to six miles, if the roads are tolerably level; it depends upon that.

16,583. And that throughout the length of a line?—I think so.

16,584. Can you give the Commissioners any idea of the average benefit per acre which under average circumstances would be conferred throughout a distance of five miles?—I should think that the increased value along the line itself would at the present time be 35 per cent. immediately adjoining a line or near to a station—within a mile. I think that within two miles of a station it would be probably something like 25 per cent., and at four miles from the station, if the roads were good and not hilly, very likely the improvement would be from 15 to 18 per cent.

16,585. (*Chairman.*) Do you mean upon the agricultural value of the land?—Yes. Of course if you get near to stations within a distance of 32 miles from London land will acquire many hundred per cent. above its original value as agricultural land. For instance, if they come within a distance where a gentleman may come to town to business and go back again, to a place where he can acquire 20 or 30 acres of land, and build himself a good house, land will go up several hundred per cent. Railways follow the ordinary rule in all countries,—where there are good roads land increases in value. With the permission of the Commission I will hand in the forms of two clauses which I think might be adopted.

The same were handed in as follows:

And be it further enacted, That if it shall appear to any justice on the examination of any person charged under the 33rd section of the 24th and 25th Victoria, cap. 100, with throwing, dropping, placing, or scattering any stone, gravel, rubbish, or other matter or thing upon any railway or works of the said company that it is not expedient to the ends of justice that the same shall be prosecuted by indictment, the justice may proceed summarily to hear and determine the same, and the offender shall on conviction thereof, at the discretion of the justice, either be committed to the common gaol or house of correction, there to be imprisoned, with or without hard labour, for any term not exceeding three months, or else shall forfeit and pay such a sum of money not exceeding ten pounds as to the justice shall seem meet; provided also, in the case of the offence having been committed by a child under the age of 12, or by a person of weak intellect, the justice may in lieu of imprisonment accept and take from the parent or person having the custody of the child or person of weak intellect, security for the offender's keeping of the peace and being of good behaviour.

Provided always and be it enacted, That (if upon the hearing of any such complaint he shall think fit) it shall be lawful for such justice, instead of deciding upon the matter of complaint summarily, to commit the person or persons charged with such offence for trial for the same at the quarter sessions for the county or place wherein such offence shall have been committed, and to order that any such person so committed shall be imprisoned and detained in any of Her Majesty's gaols or houses of correction in the said county or place in the meantime, or to take bail for his appearance, with or without sureties, in his discretion; and every such person so offending and convicted before such court of quarter sessions as aforesaid (which said court is hereby required to take cognizance of and hear and determine such complaint) shall be liable in the discretion of such court to be imprisoned, with or without hard labour, for any term not exceeding two years.

The following papers were handed in:

PRESENT :

The Right Hon. the Earl of Belmore.
The Right Hon. Lord Stanley, M.P., F.R.S.
The Hon. E. F. Leveson Gower, M.P.
T. B. Horsfall, Esq., M.P.
George Carr Glyn, Esq., M.P.
Capt. Douglas Galton, R.E., C.B., FRS.
William Pole, F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

Mr. George P. Bidder examined.

Mr. G. P. Bidder.

27 April 1866.

16,586. (*Chairman.*) The first point upon which I will ask your opinion is with respect to the expediency of Government interference with railways, and, in the first instance, with respect to the purchase of railways by the Government?—I have given this matter a good deal of consideration. Seeing that Government interference, especially through purchase, must end more or less in Government management, my opinion is decidedly that it would be neither advantageous to the public, nor in any way that I can see, to the Government. I believe the management of railways, otherwise than by parties who are directly interested in the commercial results, would be injurious in every respect.

16,587. Your evidence with respect to Ireland was that you recommended the purchase of railways by the Government?—But I think that was accompanied by the further observation that the Government should settle the terms upon which the railways should be purchased, and that they should be worked by a commercial company.

16,588. Do you consider the scheme which you recommended with respect to Ireland as applicable only to Ireland, or do you think it applicable to railways in general?—I said specially to Ireland, because the railways of Ireland, and the aggregate amount of their capital, are of a different character to those of England. If I recollect rightly, that was the substance of my recommendation.

16,589. What is your opinion, then, with respect to the expediency of any aid to be rendered by Government to railway companies by means of guaranteeing their fixed liabilities?—On that point I think both financially, and as regards railways, a very important question may be considered as to what shape it will ultimately take. It is a question which need not now be decided; but the aggregate I presume the Government credit would take is the railways fixed liabilities at 3½ per cent. on the average, or if that is converted, which I should recommend, into terminable annuities at 4½ per cent., in 44 years the whole of them would lapse, and the Government would then be in possession of the whole of the railways to deal with as they thought fit. Those who had the strongest feelings with regard to railways,—and I will mention the late George Stephenson, I am sure he never anticipated, and I am sure Mr. Robert Stephenson did not,—the enormous extent to which railways would develope the resources and the traffic of the country, and if, when railways were established, the Government had taken upon themselves the debenture debt I need not say that at 4½ per cent. there could have been no possible loss, whilst in a very few years a large amount would lapse which could either be used for national objects or in an abatement of the railway charges.

16,590. (*Mr. Glyn.*) But at the end of 43 years would there not be some inconvenience in consequence of the railways passing into the hands of Government?—No; because the Government would be receiving some five or six millions a year from the railways. They would take care to receive that weekly out of the receipts, and the Government would deal with that as they thought fit. If they thought at the end of that period that the desirable course for the benefit of the public would be that they should surrender the whole of that, they would do so upon the condition that their charges should be abated to that extent, but whether it was so applied, or whether it was applied to national purposes, the whole of that would lapse to the State to be dealt with as they thought fit. Government would not incur one shilling of responsibility, because assuming that they took any railways whose liabilities, we will say for the sake of argument, are about a million a year, the net revenue of that railway would probably not be less than three millions a year. The Government if they took on themselves that guarantee would be paid by the railway company into the Bank of England at the rate of 20,000*l.* week by week, in the same way as, before the amalgamation, the Eastern Counties paid the Norfolk Counties. At the end of that period the Government would cease paying, but they would not cease receiving.

16,591. In point of fact they would be in possession of the income of the railways?—So far as regards fixed liabilities.

16,592. In the fixed liabilities you include all the capital?—All the preference charges.

16,593. All capital?—All the preference charges not the share capital. I mean simply the preference charges. The debentures, the debenture stock, the guarantees, and preference follow one another according to the period at which the various Acts of Parliament were obtained.

16,594. (*Chairman.*) The debenture debt bears a fixed proportion to the total capital?—It does.

16,595. But the preference capital varies very greatly on different railways?—There is a great delusion about that. Parliament, originally before experience had been obtained, had enacted a sort of rough rule that railways should borrow in accordance with the extent of their subscribed capital. That has been adhered to up to the present period, and it has been adhered to under the supposition that these debentures are in the place of a first mortgage upon the railway. The legislature dealt with it like a landed estate which had a value in itself irrespective of trade. For instance, if you were calling on an insurance office to advance upon an estate at a certain agricultural rental, and they had advanced to the extent of 14 years' purchase they would have good security. But the estate of a railway consists entirely of its trade. The North-western railway, irrespective of its trade would not fetch half the value of its debentures. The Kilsby tunnel which cost 200,000*l.* or 300,000*l.* is really worth nothing. In fact the whole security is its trade. Supposing there are two railways each costing a million of money, they would each be entitled to borrow to the extent of 300,000*l.*, and if one railway is paying 5 per cent., and another railway is paying nothing, it is perfectly clear that the security is entirely different. Therefore the amount of the debentures which railways should be authorized to issue should be in respect of the value, and not in respect of the cost; one is a security, whereas the other is no security at all.

16,596. But that point it is impossible to decide beforehand until the railway is constructed?—They cannot decide it then. Up to the period of the opening of the railway it would be quite right to limit the issue of debentures; but after the railway is opened the amount of debentures the railway should be authorized to issue should be in relation to its value, not in relation to its cost. The Great Northern pays 7 or 8 per cent., while the Great Eastern is only paying, if it were free, about 1½ or 2 per cent. Surely the Great Northern should be authorized to issue a larger proportion of debentures.

16,597. (*Mr. Horsfall.*) Would not that render very uncertain the amount of the debentures if it were dependent upon the revenue of the railway, because at one time the revenue of the railway might be very good, and at another time very bad?—You are quite right in that. It should be done upon the average. It should not be the minimum of every six weeks, or every three months even. That brings me to the question of debentures, and the security that the public derive from debentures under the assumption that I have already stated, that they are the first charge on railways, and there is no other charge whatever which can come in in competition with them. Now, that is a pure delusion, and in fact, the legislature itself has recognized that state of things. There are charges which must come in before them. For instance, all contract debts, at whatever time they are due, come in in priority before debentures. It is quite a common thing for railways to order 100,000*l.* or 200,000*l.* worth of rolling stock, either waggons, carriages, or engines. They do not pay that amount down, but they pay so much every quarter or every half year. I know the practice with regard to that, because the Rock Office of which I am a director, had a proposal from a manufacturer, who had taken a large contract, to lend a certain sum of money upon it. We requested our solicitor to inquire into the nature of the security; and we were advised that it was a perfect security in the nature of a judgment of the court, and that every time we presented the coupon for the quarterly payment they must pay it, and it would come in rateably with the debentures that were at that time due, and in priority to all subsequent debentures. Therefore it came to this indirectly, that it was in priority to all debentures which were issued subsequent to the period at which each of those payments became due.

16,598. (*Mr. Glyn.*) In fact, a simple contract debt takes the preference?—It takes preference to all debentures due subsequent to the date at which that is due. It is not unusual, in fact, the railway companies had come under liabilities for a very much larger amount under that species of arrangement and which they were to meet in the mode that I have stated. If Parliament said that we could issue preference stock under the idea that we should get better terms if it received Parliamentary sanction, and we issued a large amount of stock, I say that these securities should be dealt with in some different manner, and that the public should not be deluded, as I say they are now deluded, entirely under the sanction of the legislature.

16,599. (*Earl of Belmore.*) Is it not the case that the Lloyd's bonds which are given *bonâ fide* for work done, take precedence before debentures?—I understand that is so, that is to say, they take precedence of debentures, which are subsequent to the date at which they become due. If I have a judgment debt against a railway for 10,000*l.* due to-day, and if there is a debenture of 10,000*l.* due to-day, I come in *pari passu* with that, but I come in before a debenture which is due to-morrow for 10,000*l.* Parliament is wrong in laying down rigid rules for the conduct and guidance of commercial men. What Parliament should take care of, in my opinion, is, that the public shall not be deceived, and that they shall not take up any railway security without the fullest information.

16,600. (*Mr. Glyn.*) Is there not another disadvantage that debentures have, compared with simple contract debts, and that is, that the mode of proceeding in the case of a simple contract debt is much more in favour of the creditor than it would be in the case of debentures?—I believe it is more summary. I think it should be left to the public entirely to advance money to railway companies upon such terms as they may think fit; but Parliament should take care that periodically, whether it be every three months or every six months the railway accounts should comprise, not only every item of expenditure but every liability, and every contract that they have entered into for which they may become liable, and leave the public to judge for themselves. It is impossible in the state in which the commercial money market has been for the last three or four years to lay down any conditions on which money shall be raised in the public market, whether you fix it 4, 4½, or 5 per cent. There have been periods when railways of necessity must raise money whose securities can hardly be placed at all.

16,601. (*Chairman.*) Then you would do away altogether with the present condition of things, as to a fixed amount of debentures?—Yes.

16,602. You would allow the railway companies to borrow what they like; but you would require that all their proceedings should be made known?—Everything should be known.

16,603. (*Mr. Glyn.*) How would you provide for that?—Half-yearly accounts should be published and registered, and the auditors of the company should be liable for them.

16,604. (*Mr. Horsfall.*) Would there not be a difficulty in assimilating the proceedings of railway companies who have already got Acts, and those who have not?—Not in the least.

16,605. Not with reference to debentures?—No, not in the least, because if any legislation took place with regard to this the Legislature would take care that all subsequent advances, whatever they are, must come in after the stock which is now issued; and when those debentures come in the re-issue of them would be under the new state of legislation; but of course Parliament would take care that all existing contracts should be fulfilled until they are cancelled in some shape or other. Parliament, by Standing Order 157, has declared expressly that when a railway company applies for an Act seeking to raise new capital, that capital, for whatever term it is raised, shall come in subsequent to that which is already issued, and that the existing issue shall have priority. It also enacts that clause 2 of the railway company's Clauses Act shall be embodied in the Act of Parliament that the railway companies are obtaining. That is evaded now in a very ingenious way. A new line is projected; an independent company is created; the directors probably are the directors of the company who are promoting it; but this independent company having an independent capital, do not come in under that Standing Order, and not coming in under that Standing Order, they need not embody article 2 of the Companies' Clauses Act, and therefore they are free. Then what do they do? They say that the revenue of their line shall be applied in the first instance to the payment of a certain amount of dividend, whatever the rate may be, and any surplus beyond that may be applied as the railway company think fit. Just see the operation of that. Suppose it takes 100,000*l.* a year to pay 5 or 6 per cent., and suppose the revenue does not exceed 100,000*l.*; the whole of its revenue is taken up in the payment of the dividend, and the expense of working that line, which is paid every week, comes in positively as a matter of fact, before all the existing debentures and preference stocks, so that it has, in effect, practically a priority over all existing liabilities without its being recognized.

16,606. (*Mr. Glyn.*) But the working expenses must always take priority, must they not?—I say that the working expenses must take priority. Everything in the shape of working expenses, of course, must be paid, and if there is no more revenue sufficient to pay the dividend, or perhaps not so much. It is quite clear that the working expenses on that line are a charge which come in before the existing debenture debt.

16,607. (*Mr. Horsfall.*) Did you not say that the first thing was the dividend on the new capital?—Yes.

16,608. Before the expenses?—The first charge is the dividend; then, if there is anything left it is applicable to general purposes, but if there is nothing left the working expenses must come in before the existing preference securities.

Mr. C. P. Bidder.

27 April 1866.

16,609. I thought you said that the dividend on the new capital came in before the working expenses ?—It does ; therefore I say, if there is no more even than meets the dividend, the working expenses on that line are a charge which must be met before the debentures, so that the existing debentures are not a prior security.

16,610. (*Mr. Glyn.*) Would not the working expenses even in that case come in first of all ?—Not before the dividend on that line. Supposing there is a new line from London to Birmingham, and the capital of that line is 3,000,000*l.*, and the dividend is 5 per cent. Then the clause enacts that from London to Birmingham the first charge on that revenue shall be 150,000*l.* a-year, and, after paying the 150,000*l.*, if there is any surplus it is applicable to general purposes ; it is the first charge on even the parent line. Supposing the North-western, for instance, made a new line from London to Birmingham they would have to appropriate first of all 150,000*l.* on the capital of 3,000,000*l.* ; having done that if there is any surplus they must apply it to general purposes, but if they do not get more than 150,000*l.* the working expenses of that new line will have to come out of their general revenue.

16,611. Is that the usual practice ?—No, that has been the course this year for the first time. If Parliament do not leave these things to their natural course people will be driven to adopt irregular courses ; the ingenuity of man is such that, I believe, do what you will, you cannot control them when necessity arises, in the mode of raising money ; and, as I have said, I would recommend that periodical accounts, so that the public might be enabled to judge for themselves.

16,612. Then, in fact, your alternative would be to have a statement laid before the public, either of half-yearly accounts or some other mode ?—I say, let those accounts have a statement appended to them setting forth every liability of the company. For instance, supposing a company has bought rolling stock on the terms I have mentioned, I say that should be set forth ; or, suppose they have entered into a contract for the construction of a branch or a station I say that should be set out, and if they have got any fresh powers granted, by which they are liable to alter their system, every positive contract should be set out, and that should be done under very stringent clauses.

16,613–14. (*Chairman.*) Does your view of the matter go as far as this, that railway companies should be wholly unlimited as to the amount of their capital and should be always perfectly free to raise as much money as they liked, and in any manner that they liked ?—I do not carry it as far as that, although I think, logically, it would come to that, because I think, at present, it affords no real security to the public, nor any information. In many cases that I have seen the estimates have been over-stated in the last few years, and in other cases they have been understated in some shape or another. When railway companies come to Parliament for an enlargement of their capital, if they show a necessity for it, Parliament always grants them the power. If a railway is respectably supported they will always get their capital. I think what Parliament has to do is to see that the railway itself is a useful public work on the whole, and if it is a useful public work, and the owners of the land are favourable, and there is no over-riding grievance, I think the parties should be left to raise the money in the best way they can, but care should be taken that the public are not deceived.

16,615. (*Mr. L. Gower.*) Then you would not fix any proportion between the debenture capital, the ordinary capital, and the preference share capital ?—I think I should leave each railway company to take its own course ; I should leave them to say at once what proportion, in regard to revenue, they propose to raise in the nature of mortgages, or in the nature of preferences, and, having stated that, they should be bound to adhere to it.

16,616. But if Government were to guarantee the debentures that would alter the case ?—That would be a different state of things. I am supposing that Government left them as they are ; if Government came to the North-western, for instance, and gave a guarantee for all their charges, subject to 4½ per cent., then if the company wanted any further capital of course they would have to come to the Government to know whether they would impress the Government credit upon it, or whether the company should raise it in any other way that they thought fit. The Government would not be bound by that, but the Government charge would then be the first charge.

16,617. (*Mr. Horsfall.*) Do I understand you correctly that, on the principle which has been recently laid down, the revenue of the company is applicable, first, to the dividend on new capital, secondly, to the expense of working the line, thirdly, to the debentures, and fourthly, to the old capital ?—That is, a new line being promoted by an old company ?

16,618. Yes.—The revenue, in that case, is first applicable to the dividend, and then to the debentures, if there is any receipt in excess of that.

16,619. I thought you said the expense of working the line ?—That is so with old debentures. I have given the case of the North-western projecting a new line from London to Birmingham, which would cost 3,000,000*l.*, in respect of their subscribed capital there would be a million of debt issued by the present legislation. Then upon the revenue earned upon that line, the first charge would be 5 per cent. assuming that to be the interest on three millions, whatever the debentures may have been, and then the surplus to be applicable to any purpose whatever; but it would come in before their own debentures or preference stock.

16,620. You recommend that Government should step in to guarantee the fixed liabilities of any company which should make such an application ?—Yes, I do ; in fact I am rather inclined to go further. The results are so large that I am very much inclined to think (and of course I only offer this opinion with the greatest possible diffidence) that Government should enact that all these guarantees should be taken to by Government. By no possibility could there be one single shilling of risk incurred by the State, and eventually if that were done the State would certainly have, within the next half century, from six to seven millions a year to deal with. I am quite certain that can be done with much advantage to the railways generally, and also with advantage to even the holders of these stocks. And it is so large an object, that as far as I can judge, I think it is a matter which ought to have very serious attention.

16,621. (*Mr. Glyn.*) Taking the English railways, have you at all calculated the amount of guarantee which the Government would take up ?—I have not taken it at all with any accuracy.

16,622. I thought from the fact of your giving six millions that you had ?—I say that it might be at least seven millions a year.

16,623. (*Chairman.*) The aid would be very unequal to different railway companies, would it not ?—It would.

16,624. Do you think it would be just that some companies should receive a much larger amount of assistance from Government as compared with others ?—No company would be damnified that I can see. Unquestionably, some companies would get more relief than others. As regards those companies who got the most relief, of course it would be in the power of Government to exact advantages in favour of the public to meet it where those cases arose. The difficulty is in suggesting any large general measure of that character, which is not attended with some partial injustice, that is to say, some parties always get more advantage than others.

16,625. There are cases at present where a railway company are only able to pay the interest on their debentures and preference stock ; if those amounted altogether to a large sum, and the Government were

to lend money to meet these charges, there would be a large surplus suddenly left for payment to the ordinary shareholders ?—Yes.

16,626. You would be conferring a very large sudden value upon shares which are now almost worthless ?—I take that case; I assume that the Government take up the whole of the preference charges, then of course the debentures would have to bear a higher present value than the others according to their standing. But I will take the case that your Grace mentioned of a railway in which the whole of the value is absorbed in payment of its debentures and preference charges with the Government impress of credit, and there is a sum of 100,000*l.* or 200,000*l.* a year surplus. I say that Government should have the power, with regard to that company, of saying, if we give you this relief you must give some equivalent advantages to the public. No doubt, as I said before, I believe that railways generally would be benefited, and some more than others, no doubt.

16,627. (*Capt. Galton.*) You would leave it in such a case to be settled by agreement with the Government ?—With the Government or by some tribunal to be established to adjust the thing upon an equitable basis. That was originally the view of the late Robert Stephenson at the time he was President of the Institute of Civil Engineers, he had some conversation with the Postmaster General at that time, and I regret that Sir Rowland Hill is not present, because he had a feeling at that time that the Government, by making some arrangement with the railway companies, might get their postal service done in many cases gratuitously.

16,628. (*Chairman.*) Do you consider that there is such an essential difference between railway companies and other commercial undertakings, that it is expedient for the Government to step in and give that aid to railway companies which you would not recommend to be given to other commercial undertakings ?—Yes; because Government would deal with regard to railways with certainty. They have evidence before them to show that they can incur no risk and there is a positive certainty of an enormous gain to the state. There are many other companies on a similar footing, and I do not know any reason why they should not receive the same assistance.

16,629. (*Capt. Galton.*) How do you estimate that there will be a eventual gain to the state ?—There are two ways; in the first place, at the present price of consols, I assume if you impress it with the Government credit, that 3½ per cent. would be a sufficient rate at which the security should be issued, and that would be at least from 1 to 1½ per cent. saved. What I would rather suggest is this, as a matter of general financial consideration that instead of 3½ per cent. I would make it 4½ per cent., which would more than meet any guaranteed charges, and then, at the end of 43 or 44 years, the whole of those annuities would lapse, and the Government would be receiving 6,000,000*l.* or 7,000,000*l.* a year, or whatever it might be, and there would be no charge upon them.

16,630. Then you would make them terminable annuities ?—Yes, in 43 or 44 years. I think a great mistake has been made in dealing with the annual surplus. There is a surplus of three millions. You might put that at three millions of consols. There are a great many claims upon the Government for remission of taxation; that three millions a year should not be applied to liquidate three millions of consols, it should be applied to convert 10 millions of consols into terminable annuities.

16,631. (*Mr. Glyn.*) The foundation of your calculation is, that the Government could raise this money at 3½ per cent. ?—Yes.

16,632. It is a very large sum to raise at 3½ per cent., is it not ?—I would not raise a shilling. I simply think it is a case in which strong measures would be justified by the great result. I should convert them all at once, by enactment, into Government annuities, which would be, at the present monetary value, of advantage to the holders.

16,633. (*Mr. L. Gower.*) Would not the Government have to pay a greater interest if they increased their liability ?—No; I would not raise the money, but I would convert them into Government annuities. They have had large monopolies granted to them, and Parliament have given them their powers because it is for the public benefit that they should have them, or at least it must be so assumed. I think the time has arrived when Parliament should deal with these schemes. Many people would like to hold their present securities with the Government impress of credit if that were possible, and I should convert them into Government bonds at once.

16,634. Would you make it compulsory ?—I should.

16,635. (*Mr. Glyn.*) Would you compel every person who is the holder of preference stock or debentures to take 3½ per cent. ?—4½ per cent.

16,636. One per cent. sinking fund, then there is only 3½ per cent. interest ?—Yes, I would; I think the results are so important that I should.

16,637. (*Lord Stanley.*) Do you think from another point of view that it is desirable to encourage very large numbers of people to turn their stock into terminable annuities; would you not be encouraging a large number of people to place their capital where, after a certain time, unless they re-invested it, it would be dispersed ?—I do not know of any reason why they should not, because there are large numbers of people who have done it very much to their own advantage through the errors in Government calculations; they have done it on lives.

16,638. (*Earl of Belmore.*) Might not the effect of this large alteration be to depreciate the value of the existing consols ?—No; it would not interfere with the consols; if you convert 10 millions of consols in a a year into terminable annuities, instead of buying up three millions, you raise the price of consols by it.

16,639. (*Mr. Glyn.*) Then you rather recommend this as an operation of the state ?—Certainly.

16,640. And not for the immediate benefit of the holders of these railway securities ?—I should not make it a great benefit to them; I should take care that the monetary value was more than the present market price of the securities.

16,641–2. (*Capt. Galton.*) You would give such an amount of this new stock to the holders, as would fairly represent the value of what they held; for instance, a man who held six per cent. stock of the North-western, if there were such a stock, would of course receive more than a man who held 6 per cent. stock, in the Great Western ?—I know a great many 6 per cent. stocks which are now at par although they are perfectly secure. It arises from this circumstance, that where securities are so small in amount, there is no market for them. They are all very well to hold, but when you want to realize you can get no market for them. You have a large amount, say 100 millions, of one great stock; that of itself would be like consols; it would be like bank notes capable of being used in any emergency which might arise, there would always be a market for it; whereas these securities, from their not being of so large an amount, would find no market.

16,643. (*Chairman.*) Do you know what is the average interest that the railway companies pay on their debenture ?—I can ascertain it.

16,644. Do you imagine that it exceeds 4½ per cent. ?—I think it does; because owing to the state of the money market I know that the North-eastern Railway company have been raising money at more than 4½ per cent., and many first-class railways have been raising money at 5 per cent.

16,645. (*Mr. L. Gower.*) To what extent does it vary, what is the highest and what is the lowest ?—I cannot tell you; I know of 6 per cent. debentures, and I know some that have been issued in former times, when the money market has been very easy, at 3½ per cent., but I know at the Rock Insurance Office that we will not now advance on debentures under 4½

Mr. G. P. Bidder.

27 April 1866.

per cent. which formerly we were very glad to do at 4 per cent.

16,646. Until recently all the larger companies have borrowed at a lower rate than 4½ per cent. ?—I know some of them who have borrowed at 3½ per cent.

16,647. Unless the average rate of interest at present exceeds 4½ per cent. railway companies would not have any further gain by having Government assistance ?—I am taking all the stocks, all the preferences and everything else, and I feel convinced that they average more than 4½ per cent.

16,648. I suppose there is very little preference stock under 5 per cent. ?—Very little, what has been issued has been issued years ago. I know when the Great Northern were discussing with the Great Eastern that they said even with their security they could not get anything out under 5 per cent. It is only by chance during the last six months that large railway companies have got 5 per cent., and where there is the slightest row or suspicion they cannot get that, although their security is as good as can be.

16,649. Do you know whether preference stock generally is redeemable or irredeemable ?—Some has been redeemable, but generally speaking I think the bulk of it is irredeemable.

16,650. But you would treat it all equally as irredeemable ?—Yes. For instance, I take Captain Galton's 6 per cent. I hold 6 per cent. stock; I am quite certain to-morrow, if I wanted to sell it, I could not get par for it, although it is a perfect security. You would not give me more than 4½ per cent. by terminal annuity on that because I could not get par for it now.

16,651. Would you require in return for this aid from Government any advantage to the public in the way of reduction of fares or otherwise ?—As I said before, I would deal with it in two ways: where this 4½ per cent. would leave a large margin to a railway company, in that case I would exact an abatement of charges on certain classes of goods traffic. Where a reduction of rates is most wanted is, in my view, upon all the heavy articles of traffic. Upon all articles of manufacture, and heavy articles consumed in agriculture, a reduction is required, such as coal, iron, stone, bricks, timber, and mangold wurtzell for the London market. I have known the normal value of mangold wurtzell in Norfolk to be 7*s.* a ton, and it has been selling in London for 20*s.*

16,652. (*Lord Stanley.*) Do you not think there would be a continual pressure upon Government if they were making such pecuniary advantages out of such an arrangement as you propose, to sacrifice those advantages for the sake of lower fares ?—The Government would have no pecuniary advantage until the annuities had lapsed. Then what pressure would be brought to bear upon the Government at that period I can hardly anticipate. I should hope that it would be applied to general State purposes.

16,653. (*Capt. Galton.*) At the end of the 43 years, to whom would the greater revenue go ?—The Government. The Government are to receive from the railways in perpetuity 4½ per cent. Of course, at any time they might say to the railway company, "We will give up our 4½ per cent., but you must "reduce your rates *pro rata.*" Of course the Government would have the power of doing so, but the Government would continue to receive that sum from the railways.

16,654. (*Mr. Glyn.*) In fact, your proposition is, that the Government should take from the railway companies a certain benefit ?—Yes.

16,655. Guaranteeing for their preference stock, upon the credit of the Government, a lower rate of interest, and the revenue is to go into the pockets of the Government eventually ?—Yes.

16,656. (*Capt. Galton.*) For instance, if that 4½ per cent. was not lower than what the railway companies could borrow at, what advantage would it be to the railway companies to do this ?—I say that I believe the 4½ per cent. to some railways would be of no advantage at all, while to other railways it would be of very great advantage; it would generally improve their credit, but I fix it at 4½ per cent. with a view that the annuity should lapse, and the Government or the State should have the whole amount to deal with. Of course there are other ways of dealing with it which would give a pecuniary advantage, one of which is to make it 3½ per cent. perpetual stock; then you would have 1 per cent. profit, which you would either give to the railway company or use for State purposes. If you gave it to the railway company you would exact from the railway company advantages in favour of the public traffic.

16,657. You would not make it at all optional on the part of any railway company to come into it ?—I think it is so important, and the objects to be achieved are so wide, that I should be inclined to make a positive enactment.

16,658. You would make it compulsory upon all companies ?—Yes.

16,659. (*Mr. Horsfall.*) Would you impose any obligation upon the Government as to giving up the 6,000,000*l.* or 7,000,000*l.* of surplus ?—I think 43 or 44 years is a long way to legislate.

16,660. (*Mr. L. Gower.*) Would you in that case fix a proportion between the fixed liabilities of the railways and the ordinary shares ?—No; I should take the fixed liability of the same period, and then, if the railway company for its own objects seeks to require further capital, as probably they will, then it will be for the State to say whether, upon the additional fixed capital, they will give the State credit or not. If they do not give the same credit it must be raised in some other way, subject to re-charging it. I take it the State should take care that its payments should be before any subsequent debt of any character whatever.

16,661. (*Mr. Horsfall.*) Looking at the period when this 6 per cent. premium will arise you do not propose that it should be operated upon in any way for the benefit of the railway companies, or for the travelling public; you are only looking of course to the general interests of the country ?—Yes, I do not know that you can put it in any better way, but whether it is better that you should apply it to a reduction of general taxation or the liquidation of the National Debt, or a reduction of charges will be matter for consideration, it is a great public object.

16,662. (*Lord Stanley.*) What you propose, as I understand, is simply this, that the Government should make a profit out of its credit and its command of capital by borrowing money upon easier terms and lending it upon higher terms ?—I do not propose to borrow any money.

16,663. Practically you do ?—I would convert them into Government stock, and of course the Government would meet that upon its credit. It is quite a common thing for one large railway company to guarantee the liabilities of a smaller one, the smaller one getting the advantage of the larger one's credit. This would be on a large scale.

16,664. (*Capt. Galton.*) In the case of a railway company desiring to borrow additional money for new works would you place any limit on the amount which it should be able to borrow under the general guarantee ?—No; it would be quite open to the Government then to deal with that independently, they would raise that money subject to any charge which the State would have on their revenue. The Government might say to the company, we think it desirable that the railway should be made for Government objects, and if you construct the line we will then lend you the money on favourable terms. If the railway is projected by the company for its own objects they would come to the Government and say "These are our objects will you assist us or "shall we go into the open market ?"

16,665. (*Chairman.*) Are there any railway companies in England who are not able to pay their guaranteed preference stock ?—They must be very small indeed.

16,666. (*Mr. Glyn.*) Are there any instances of that sort at all ?—I do not know of any, if there are any they must be very small. They have been remarkably well sustained.

16,667. (*Chairman.*) There are cases of that kind in Ireland, are there not ?—Yes.

16,668. Supposing such cases to arise, might not the best way of giving Government assistance, be to enable them to get rid of their ordinary stock which is worth but little, and then convert the preference stock into ordinary stock ?—I do not exactly see the operation of that.

16,669. The preference stock in such cases, is, in fact, ordinary stock ?—What benefit would the preference stock get by that operation ?

16,670. One complaint has been that some Irish railway companies are in such a position that they are managed by persons who have no real interest in improving the position of the railway ?—Yes ; I think the case of the Caledonian Railway has some analogy to that. In the early stages of the Caledonian Railway its stock went down to 16 or 17 on account of its preference shares absorbing so large an amount of its revenue. The ordinary shareholders said to the preference shareholders, "If you do not meet us we "shall not go on working it for your benefit entirely;" and they made an arrangement by which they all abated the rate of interest, and they got parliamentary sanction to it. I need not tell your Grace that the ordinary stock of the Caledonian is 130 or 140 ; I do not think that that was exactly an equitable transaction.

16,671. Many complaints have been made by witnesses who have appeared before this Commission with regard to the great inequality of mileage rates ; what is your opinion upon that question ?—It is absolutely essential. There must be an inequality of mileage rates.

16,672. Will you state more fully the reasons why you consider an inequality of mileage rates is necessary ?—I think I have already stated that the great object of railways should be, if possible, to assimmilate them to the Post Office, and to have one charge to every place where all manufactures and necessaries of life may be fairly put in competition with each other. That of course on railways is practically impossible to that extent; and the only way you can meet it is this by having terminal charges properly apportioned, and that the mileage rates should be reduced as much as possible and should be particularly reduced with regard to the length over which the traffic passes. To a great extent you meet that state of things by a properly arranged terminal charge so as to reduce the mileage. If possible the mileage should simply be the actual cost of working. The whole thing should be covered by terminal charges, I mean that out of a ton of coal or anything else the railway should have three or four shillings profit, I will assume it to be 2*s.* 6*d.* I should fix that profit and then above that charge no more than the actual expense of conveying that coal to the manufactures at any distance so that the only different rate to which they would be subject would be the actual cost of transport.

16,673. (*Mr. Glyn.*) Why is that to be settled by a terminal charge ?—The terminal charge is in another sense a mode of settling the legitimate profit which you have to derive from the conveyance of goods.

16,674. The terminal charge is for actual work done ?—The terminal charge only includes the profit.

16,675. The Act of Parliament, if I remember right, says that the terminal charge must be a reasonable charge, and therefore that will not include more than the profit on the actual capital laid out ?—What I said was that the terminal charge as soon as you could fairly raise it should be made to attain that object. The only way to attain it would be to fit a profit which you mean to derive upon any particular article whereas in the case of a terminal charge you must over and above that profit only allow the actual expense you are at.

16,676. (*Mr. Horsfall.*) Then you will have one charge, including the cost of conveying the traffic on the line and the terminal charge ?—Yes. For instance, the Post Office do that ; they charge a penny for a letter which is conveyed from this building to Great George Street, and they would charge no more if that letter was sent to the extremity of Scotland. They can do that because the Government receive 300*l.* per ton for the letters that are conveyed. That is so enormously above every charge, that whether it goes to the north of Scotland or anywhere else is quite immaterial, therefore they can afford to charge the same rate to every place. But with regard to railways you cannot do that, therefore you must approximate to it as much as the nature of things will allow. London has become a great manufacturing place ; very large establishments are growing up on the River Thames, such as ship-building yards, and a variety of works. It is an enormous disadvantage to the manufacturers in London that the price of coal is so great as compared with what it is in Newcastle or Staffordshire. I say upon those articles, it is very desirable that the rate should be reduced as much as possible, and equalized.

16,677. Do you think that if there was one uniform charge, including terminal charges, that that would obviate the objections which are now urged as to most of the terminal charges ?—The object I have in view is, that raw articles of consumption should be supplied to manufacturers, wherever they may happen to be, with the least possible difference of charge.

16,678. At one fixed rate ?—You cannot have one fixed rate. Take the case of a ton of coals ; the railway are to have 2*s.* 6*d.* profit, so that they should only superadd to that 2*s.* 6*d.* the actual cost of the transport of the coal to any place, that is, the actual expense they are put to in the conveyance of that ton of coal.

16,679. And the actual expense of the terminal ?—Yes, which might include the 2*s.* 6*d.*

16,680. You do not recommend that the maximum fares and charges should be diminished, but that the railway company should be allowed to charge something in addition not at present legal, included under the term terminal charges ?—I believe the railway companies do, all, under their present rates.

16,681. It would be merely an alteration in their system ?—I think they could do it themselves, pretty nearly, if not quite.

16,682. (*Mr. Horsfall.*) That would obviate any difficulty about terminal charges ?—It would.

16,683. (*Chairman.*) In your experience as a railway director have complaints been frequent with respect to inequality of rates ?—No. Complaints with regard to the inequality of rates do not happen to have prevailed in our district, that I am aware of.

16,684. Are you aware that the traders in some towns complain that the traders in other towns have great advantages over them ?—They did complain before I joined the company. That was tried at law. That was a complaint by the coal importers at Ipswich who complained that the company were conveying inland coal from Peterborough at the rate of $\frac{1}{2}d.$ or $\frac{3}{8}$ths of a penny per ton, whereas they were charged 1*d.* per ton, and that they paid a larger rate for a short distance. They said either raise the rate from Peterborough up to 1*d.* or whatever the rate was, or lower us to the rate you charge the people at Peterborough. That is a case in point. The railway company said, it does not pay us to find you waggons occupying our station and only carry your coal 10 or 12 miles at a $\frac{1}{2}d.$ per ton per mile, whereas it is worth our while to carry 60 or 70 miles from Peterborough at $\frac{1}{2}d.$ per ton per mile. In France they are carrying coal at $\frac{3}{8}$ths of a penny per ton per mile, all the way from Dunkerque to Paris.

16,685. (*Capt. Galton.*) Was the inequality of rates which prevailed upon the Great Eastern due in any

Mr. G. P. Bidder.
27 April 1866.

way to competition ?—No, not to competition ; because they had no line at all in their district to compete with them. It was simply from the fact that they encouraged the traffic which travelled the longest distance over the line, because they thought they got more out of it.

16,686. (*Chairman.*) They were desirous to favour the traffic which travelled the longest distance ?—Yes. The Ipswich people might have sent 60 miles for a ½*d.* if they pleased, or the Peterborough people would have been charged 1*d.* if they only sent 12 miles. There was no inequality as per ton ; anybody might have sent on the same terms.

16,687. Provided they sent full train loads the same distance ?—Yes.

16,688. Then in fact the inequality of rates was used by the Great Eastern Company solely as a means of obtaining the greatest amount of traffic on its line ? —Yes. With regard to the cattle trade they were charging 12*s.* per head from Yarmouth or Lowestoft to London, which cattle were only charged 5*s.* per head by steamer from Tonning. The steamer said, we having a vessel in steam and full of cargo can only compete at a certain rate to London ; because the General Steam Navigation Company have steamers which run to London direct. The parties cannot afford to pay more than 5*s.*

16,689. Did the Great Eastern make a rate all the way from Tonning to London ?—No. The General Steam Navigation Company were running their steamers, and they charged the same rate to London. The shippers running to Lowestoft said we cannot afford to pay you more than 5*s.* per head to London.

16,690. (*Capt. Galton.*) Then it was an advantage to the parties to have those cattle conveyed in that way, was it not ?—Yes, the cattle came up in better condition.

16,691. (*Mr. Horsfall.*) Will you explain what you said just now, that it would pay the railway company better to carry 60 miles at a ½*d.* per ton than 10 miles for 1*d.* ?—The company in carrying 10 miles at 1*d.* of course could only get 10*d.* Therefore they could not get more than 10*d.* profit. And assuming the profit is 50 per cent., they would only get 5*d.* ; whereas out of 60 miles at a ½*d.* you get 2*s.* 6*d.*, and instead of getting 5*d.* you get 1*s.* 3*d.* upon the coals. Therefore every ton of coals that went from Ipswich to Stowmarket, or Bury, would yield a very small profit ; but upon a ton of coals that came from Peterborough they would get the increased profit which I have mentioned. It would be carrying coals 60 or 70 miles as compared with 10 miles.

16,692. (*Capt. Galton.*) But perhaps you would not get the same proportion of profit out of goods carried at ½*d.* per ton per mile as you would out of goods carried at 1*d.* per ton per mile ?—Yes, it is a long run. If you have to start a train from Ipswich, and you have not a full train load at Stowmarket or Bury, you would have to start with a train of perhaps 20 carriages, and two or three of them would have to be left at places along the line, the engine would be running the whole way, and you might as well take that ton of coals an additional distance, because the additional cost of the locomotive power is inappreciable.

16,693. (*Mr. Glyn.*) In point of fact the profit arises from the character of the traffic ?—Yes ; we had that carefully considered in the project of the Northern coal line. We had a special rate for that.

16,694. (*Capt. Galton.*) By dropping the traffic at places ?—Yes. According to distance the rate came down to ¼*d.* a mile.

16,695. That was for a long distance ?—Yes.

16,696. (*Chairman.*) Do you think it is a right principle for railway companies to receive all the traffic they possibly can if it leaves any margin of profit, however small ?—Yes.

16,697. If they can make a profit they should take traffic at a low rate ?—Yes. It is just like trade ; you must fix your price if you want to get the business ; there is no other way of making a profit.

16,698. (*Mr. Glyn.*) You cannot lay down any fixed rules ?—No.

16,699. There must be a commercial principle applied to railways as well as to other matters ?—Yes.

16,700. (*Chairman.*) I believe you have some observations to make with respect to capital accounts ? —I think what I have said to a great extent relates to that, because I have alluded to the fact that, with regard to railway capital, you will find, if you were to go through a list of railway capital accounts, 20 or 30 descriptions of capital, and the consequence is, that there are many descriptions of securities so small that there is no market for them ; therefore I say one great advantage would be if all these different descriptions of securities could be thrown together under one head, so as to make it as large as possible, but that would be of course over all the railways if the whole of the companies were merged in a Government guarantee, but even without that, if you cannot do that, it would be of very great importance to railway companies, as well as to those holding stock, if, upon an equitable basis, the whole of the preference capital of the company could be consolidated.

16,701. What is there to prevent railway companies proposing to do that now if they think it desirable ?—In the first place you must get legislative enactment ; in the next place you must get all parties to agree. If I hold 100*l.* worth of stock out of 100,000*l.* worth of stock, and I choose to withhold my sanction, I do not believe Parliament would give it.

16,702. What measures would you recommend, supposing the Government not to interfere ?—I should recommend that power should be given to railway companies to consolidate their stock, and if the parties could not agree on the terms on which such consolidation should be effected, that then there should be some tribunal created with a view to adjust it, presided over by some eminent judicial authority, aided by the advice of a public accountant and an actuary.

16,703. You think, speaking generally, that the value of all preference stock is reduced, from there being a great variety and different classes of stock ?—No doubt about it.

16,704. Then why should the holder of that stock object to its being consolidated if it would increase the value ?—It arises in this way. I hold a 6 per cent. stock which is not marketable, however amply secured. I am content with 6 per cent. ; I do not want that brought into the general stock, on which, instead of 6 per cent., I should be receiving 5½ per cent. in lieu of my 6 per cent. I prefer going on with my 6 per cent., and I prevent the majority, who desire the consolidation, from being able to carry out their views.

16,705. Would you require the assent of a majority of the holders of that stock ?—Certainly.

16,706. Do you think that in general could be obtained ?—I should think to a great extent.

16,707. Does it require the consent of every individual holder ?—Certainly ; you cannot do it legally without, and I believe you would have great difficulty in getting Parliament to sanction it if any individual holder chose to go to the expense of opposing it.

16,708. (*Capt. Galton.*) In the case of the Caledonian they overrode those objections ?—They were frightened into it.

16,709. Parliament would not listen to any objection of that kind ?—No. I imagine the recommendation of this Commission that such a thing should be favourably considered by the Legislature would probably have all the effect that we want.

16,710. (*Chairman.*) Is there not an advantage in having different classes of stock ; does not the 6 per cent. stock suit a certain class of holders, while another class of holders would prefer other stocks ?—If it was a large stock, that would be easily convertible, but it is the small stock which is quite inconvertible to the bulk of those who hold it ; and what is inconvertible in a case of necessity must be converted at a great sacrifice.

16,711. As I understand you, you think that companies, when they require new capital, should be allowed to raise it in such a manner as they think best, either by creating additional shares, or by borrowing ?—Yes, only taking care that they do not come into the market until the public are thoroughly informed of the whole financial state of that company.

16,712. In that case, if the company does not require to buy any additional land, it would not be necessary for them to come to Parliament if they wanted to raise additional capital ?—If they did not want the capital of course they would not come.

16,713. I thought you would allow them to raise it by borrowing ?—Yes.

16,714. Would you allow them to do it without the sanction of an Act of Parliament ?—Yes; if they had got powers over the land, but of course they must have it first.

16,715. (*Capt. Galton.*) I believe in America they can borrow any amount they choose ?—You never know where you are there, I believe; the last debt overrides the first. I certainly do not propose that under any circumstances. What I propose is, that a railway company shall be allowed to raise its capital in the best way it can under the particular state of the money market, but taking care that they do not come into the market before the whole of their financial statement is fairly before the public, the public having ample means of judging for themselves.

16,716. How would you ensure its coming before the public ?—I should think that in addition to the statement of their costs for the previous half year, that they should set out the whole of their liabilities, of whatever kind they may happen to be, whether they are contracts for land, contracts for works, or payments for rolling stock, which are frequently paid for by annual instalments instead of by payments of money down. All these are charges which come on revenue, and therefore come into their liabilities.

16,717. How would you ensure that there was a correct statement put forward; would you make it a misdemeanor upon the part of the directors or secretary if a correct statement was issued ?—Certainly.

16,718. (*Mr. Glyn.*) I understand you to say not only all payments, but all contracts ?—All payments of any kind.

16,719. (*Capt. Galton.*) You would not have the Government aid, but would leave it to the common law ?—Yes. At present a railway company is not bound to set forth its cash liabilities. I think they should be bound to set forth every possible liability, whether actual or contingent, that can come upon them.

16,720. Do you think the inducement which occasionally exists of concealing some of their liabilities would not be sufficient to cause a concealment if it was made a misdemeanor ?—I think not; I think they have very little desire to conceal. There may be various ways of viewing the thing, and no desire generally to conceal anything. There have been only two or three cases of the kind, one of which was the Hartlepool Railway. I was the first who found that out. That is the only case I know where there has been a wilful deception.

16,721. Do I understand clearly that according to your view it would not be necessary for the company to go to Parliament if they required money to raise additional capital, if they did not want additional land ?—I think not.

16,722. Then it would become a matter of very little consequence to railway companies what capital they applied for in their original Act, if at any future time they could raise such additional capital as they required without coming to Parliament ?—There are not many original Acts of companies which give any indication of their existing capital.

16,723. (*Mr. Horsfall.*) Can railway companies at present actually borrow any amount of capital they please without coming to Parliament ?—They must come to Parliament.

16,724. Do you recommend that they should be able to borrow any large amount without going to Parliament ?—Certainly.

16,725. (*Earl of Belmore.*) In fact, you would do away with the limit to borrowing powers ?—Yes.

16,726. (*Mr. Glyn.*) You would allow them to use their commercial credit like any other commercial body for the purpose of raising money ?—Precisely. The credit of a railway company and its liabilities can be made so manifest that the public are better judges as to how they should advance their money, than I think it is possible for Parliament to be. Whether you give them freedom at once or not, you compel them to come to Parliament to increase their capital account. I know a case at this moment where 5,000,000*l.* of security have been issued, and only $2\frac{1}{4}$ millions of cash received.

16,727. When you say securities issued, do you mean Parliamentary securities ?—Yes.

16,728. (*Capt. Galton.*) Issued out at a discount, in fact ?—In all manner of ways, commission, discount, and so on.

16,729. (*Mr. Glyn.*) In point of fact those securities were issued at their market price ?—No doubt.

16,730. The commercial character of the company being known, they only get the value of their commercial character ?—Just so. If you make that company quite free, I believe they would get better terms.

16,731. (*Capt. Galton.*) If you adopt the plan of removing all restrictions from the company as to how much capital it should borrow, how would you deal with those companies who at the present time have already borrowed a large capital ?—All subsequent advances must be subject to the charges already existing.

16,732. They would all be prior charges upon the undertaking ?—Yes.

16,733. (*Mr. Horsfall.*) Would you extend that power of borrowing to other companies than railway companies ?—I have not considered that point.

16,734. Do you think it would be equitable so to do ?—My consideration of this subject has been particularly with regard to railways, and I do not feel that I have sufficiently considered that point to be able to answer the question.

16,735. When you make the recommendation with regard to other companies, have you not given some consideration as to how far it would be desirable to extend that power to other companies, or how far it would be just or unjust ?—If you take companies whose status can be ascertained as well as railways, I would take canals as an example, there is no reason why they should not get it; but what other companies come and offer the same securities as railways I do not know. If you take a trading company or a bank, they do not.

16,736. (*Mr. Glyn.*) Suppose you take a dock ?—If you take a dock, I think you might; but anything which can make away with property in three or four months by advances, or encountering liabilities, is not in the same position as a railway; but where property is of the same character as a railway, such as a dock or a canal, I do not see why they should not have the same power,

16,737. (*Chairman.*) Most commercial companies can borrow to any extent they please, can they not ?—It depends very much upon the deed under which they are registered.

16,738. (*Capt. Galton.*) And a good deal upon their credit ?—Yes.

16,739. (*Chairman.*) What are your views with respect to the extensions within a so-called company's own district ? For the last three or four years that has been carried out very anomalously. For some years past there has been no such thing as a subscription contract before Parliament. When there were subscription contracts they were never enforced, and neither for many years, I believe, could you get

Mr. G. P. Bidder.

27 April 1866.

a subscribed capital to any new project. Yet on the other hand it is undoubtedly within our knowledge that there are many branches in districts where it would be very desirable, and where the landowners are very desirous of it, and where the existing companies are disposed for many reasons to oppose them. I think that if companies are to receive any assistance or protection from Government, they should be in some shape or another under a constraint to afford these new lines fair assistance. In the first place, I should take care that these lines are really *bonâ fide*, and that the landowners should show some substantial proof that they are approving of them, and then, subject to that, Parliament should sanction them and seeing that they cannot be worked independently; for it is impossible to work any small line independently; no small railway can be worked without absorbing all its revenue, if not more. I think that the companies holding that district should be under a liability of working it at 50 per cent.

16,740. Do I understand you to propose that no such extension should be made, unless the landowners in some substantial way show that they take interest in it?—Unless there be some apparent object that can be proved to the satisfaction of Parliament. I have known cases where lines have been set up which had really no object beyond that of supplying a district which was not permeated by railways. They set out by saying they have got the sanction of the landowners, and it turns out that the landowners have not taken a single share. If the landowners do not take any shares, it does not appear to me that there can be any crying necessity for the railway. Where they do show an interest, and are prepared to take a stake in the railway, I think in that case that the line should be sanctioned, and that the company in whose district it is should be obliged to work it at 50 per cent., which they can generally do without any.

16,741. (*Mr. Horsfall.*) You would not make them find capital?—No.

16,742. Do you think any regulation could be laid down to ensure that those lines were of a *bonâ fide* character?—I think the existing regulations are sufficient. In the first place, with regard to the deposit, I would recommend that there should be the names on the Bill as now, and that they should be the names of gentlemen of the district and of position, and then that the landowners should subscribe capital to the extent of their land taken.

16,743. Would not those conditions be evaded in the same way as in all attempts hitherto made they have been evaded?—It is difficult to say what cannot be evaded; but I think that where an existing railway company really had a substantial object, you might leave it to them to detect the evasion.

16,744. Do you think what are commonly called speculative lines, that is, lines got up by contractors and engineers, are objectionable?—No, I do not on the whole. Some of the very best lines have been so got up, and among them are the Metropolitan and the Metropolitan District.

16,745. If landowners had been required to take a substantial interest in those lines, would it not have been impossible to have executed the greater part of them?—Certainly.

16,746. In most of those cases do you think you could get the concurrence of the landowners?—Not in the Metropolitan Railway, but in local districts or rural districts I think it should be a condition, showing that it was a *bonâ fide* line, that the landowners should, according to the extent of their land taken, take stock; that would be clear evidence that the railway was wanted.

16,747. (*Capt. Galton.*) You would not limit the great companies from making extensive new lines in any way?—Certainly not.

16,748. Whether they were interfering with the district of another company or not?—So far as my experience goes, all the great companies dislike competition, except where they inflict it themselves. There is not a great company that I know of which has not sought to invade its neighbour's territory; then it is all right; but if you touch theirs, then there is a cry raised about competition. I do not know any great railway company which has not asked of the Legislature to penetrate their neighbour's territory wherever it could.

16,749. You would leave that still to go on?—Certainly.

16,750. (*Chairman.*) You would not attempt to introduce any measure to prevent aggression by different railway companies upon one another?—No; there are very few railways that have been made that have not returned to the public in some shape or another an ample interest upon the outlay; if you take the whole railway system, the whole capital of the railways. Some little time ago I went through the calculation, and I found the minimum that it paid the nation was 15 per cent.

16,751. How do you estimate that they paid that to the nation?—I take all the existing traffic. I take it in this way. Supposing the railway system annihilated, at what rate could the traffic be conveyed. Of course the answer to me would be this, that a great deal of that traffic would never run at all. Then I say, probably the loss to the nation may be even greater by the traffic not being carried at all, or if carried it would be carried at increased rates, but taking the increased rates, it pays the country 15 per cent. on the whole.

16,752. (*Mr. L. Gower.*) Would the plan of a Government guarantee be a stimulus to the making of railways?—I think it would. Do not understand that I recommend a Government guarantee on the cost of any railway. I only recommend the Government guarantee to the extent of a portion of its capital, as far as the railway is concerned, as to the extent of its existing liabilities. In the case that was put of a new railway, if the Government chose to take part of its obligations upon themselves, they must judge of the merits of that particular railway when it is formed. The objection to laying down a fixed rate is that until the traffic is worked you do not know to what extent the debentures can be fairly issued, because the estate of a railway is worth nothing comparatively speaking.

16,753. (*Chairman.*) Then I understand it is distinctly your opinion that no attempt should be made to check the attacks of one railway company upon another?—No.

16,754. With respect to competing lines, I believe your opinion is that sometimes they are beneficial and legitimate, and sometimes not?—Generally speaking, I think on the whole they have been beneficial, but there are cases where it has not been beneficial. Take the case which I argued out with Mr. Booth at the Board of Trade, and also before the Commission which sat on Railway Legislation three years ago. I take the competition to be useful and legitimate, such as that which exists between London and Manchester. You have the Great Western route and you have the Great Northern route. The Great Northern became competitors because between Manchester and Sheffield a railway is required for local purposes, and an extension down to the Retford district was required. Of course the Great Northern penetrating there intersected it, and so opened out an additional communication to Manchester. The result is that Manchester gets a choice of trains by two routes, and there are very frequent trains. The number of trains has been increased as the traffic increased. Whether the route is *viâ* Crewe, Birmingham, or Stafford, or *viâ* Retford, Sheffield, and Peterborough, it is equally convenient for traffic to the north. There undoubtedly competition has been decidedly in favour of the public, and it is a legitimate competition that has arisen entirely from the interests of the intermediate districts. But suppose that instead of going to Manchester through a populous district *viâ* Peterborough, Retford, and Sheffield, you had gone through a desert with no traffic at all, what would

have been the result. As there would be no intermediate traffic between Manchester and London, you would have no more trains, and the company would, to that extent, simply say the same as other companies: As we cannot advantageously work the traffic, but have the power of lowering your rates and destroying your property, we will leave you the traffic, but you must pay us black mail.

16,755. (*Mr. L. Gower.*) Do you know any case in which that has actually arisen?—I know of no case where that has arisen at all.

16,756. (*Chairman.*) You cannot give us any instance of what you consider illegitimate competition?—I could; but I must ask you not to press me for it, because it is a case in which I have to give evidence.

16,757. But it must be very difficult to draw any line of distinction between what is, in your view, legitimate and illegitimate?—I give as an instance where you have to go through a district which cannot give traffic from end to end, and where the line does not offer any advantages as regards directness, or gradients, or anything else.

16,758. In almost all parts of England there must be a certain amount of local traffic, which will always give a colourable ground for granting a new line?—I could quote a case that I think very nearly comes to the desert.

16,759. Has the result of the competition of competing lines been to lower the fares generally?—I think no doubt it has; and, besides that, it is beneficial in this respect, that both railways agree to try to get the public favour by doing their work one better than the other, as far as they possibly can, and the public get the advantage of that; they get the advantage of more trains and more speed.

16,760. It used to be alleged that in the case of competing lines after a certain amount of competition, companies would probably agree to raise the fares; has that in practice been the result?—They raised the fares from the extreme rates at which they were then put between London and Manchester. I take the case of the Great Northern and the Great Eastern. The Great Northern very recently commenced working their own line to Cambridge; the Great Eastern worked it under a lease from the Great Northern, but recently that line lapsed to the Great Northern. Three or four years ago I said to the Great Eastern, "You must come "down to the Great Northern rates, and therefore "I advise you to do it at once, and have the benefit "of our increase of traffic, besides getting your-"selves established there before the Great North-"ern knock down your rates, when you will not have "the credit of saying you had anticipated it and had "met the public there." They did that. The Great Northern fixed that rate undoubtedly. But with regard to the Ipswich rate, where the Great Northern cannot touch them, I could not induce them to lower the rates, although I am morally certain it would have been to their advantage.

16,761. (*Earl of Belmore.*) Are not the fares on the Great Eastern considerably higher than those on some of the other great railways?—On the Ipswich route they are, but not on the Cambridge route.

16,762. (*Capt. Galton.*) From London to Cambridge, which is 56 miles, the charge would appear to be greater than for 60 miles on the North-western?—Yes, that is possible. I could not get them down to the Great Northern rate. They approximate within 6*d.* of the Great Northern. The Great Northern is about 2¾*d.* per mile; that would make it about 11*s.* to Cambridge. I got them down to 11*s.* 6*d.*, or thereabouts.

16,763. (*Chairman.*) What is your opinion with respect to amalgamations?—I believe that amalgamations have eventuated very much to the benefit of the railways, and I think very much for the benefit of districts where they have taken place.

16,764. Do you think any steps should be taken which would tend to increase amalgamations?—No, I should think that the simple expression of the opinion of this Commission would be very useful. I will take the railways which are south of the Thames. There are four companies there. I am quite convinced if they were consolidated it would be very much for the benefit of the public, and undoubtedly very much for the benefit of the companies. The Legislature would of course take care, when legislation does take place, that it does not have the effect of stopping all railway progress in these districts; in fact, they do it now, and that is where I am surprised that Committees do not take much stronger action than they do. Where railway companies agree upon a territorial division, and they agree *inter se* that they will not encourage lines that intersect that territory, they oppose any new project. By that means the district between them is really suffering very much from the difficulty of getting legitimate railway accommodation; and they often parade their grievances before a Committee, because one party or other are sure to break them, and when they come before the Committee they say, "Look at the great breach of agreement which there has been here. The Committee have nothing to do with the agreement. If they have made an agreement which has the force of law, why do they not go to law? What the Committee have to do with is to see that the line is for the benefit of the public.

16,765. (*Capt. Galton.*) When you refer to the four companies south of the Thames, I presume you allude to the London, Chatham, and Dover, the South-eastern, the Brighton, and the South-western?—Yes.

16,766. How would that operate upon continental traffic; would it not cause the rates for continental traffic to be raised?—I should think not, because with regard to the continental rates, like all other rates, they find it to their advantage rather to lower them than to raise them. But at all events as regards the existing rates Parliament, in granting the amalgamation, can make its own conditions.

16,767. From London to Paris by way of Newhaven, or Southampton, as compared with London to Paris by the South-eastern, a very low rate is charged, which rate depends upon the French companies?—Yes.

16,768. Parliament could not have any control over that?—No; but when you are amalgamating English companies, you are not amalgamating French companies. Therefore if you establish a rate from London to Havre, or to Dieppe, of course, if you fix that rate, the French companies will take care of themselves.

16,769. (*Chairman.*) Some of the witnesses have given it as their opinion that the amalgamation of parallel lines would not be advantageous to the public; do you see any distinction between what are called parallel lines and the others?—No, I do not.

16,770. (*Earl of Belmore.*) Do you think it would be of advantage to amalgamate the North-western and the Great Western in places where they have lines which run parallel?—I think there is a limit to amalgamation. It is a question how far two such large systems as those could be conveniently worked under one head.

16,771. You think the North-western is now as large as it conveniently can be worked?—I would not say that; I think it must be approximating to that at all events, but whether it would be well to amalgamate such a large system as the Great Western with that, is a question which would require grave consideration. Whether it has reached its limits of amalgamation within 100 miles or 200 miles I cannot say.

16,772. (*Capt. Galton.*) Do you think it would be very inconvenient to the public if all the railways of England were amalgamated together?—It would not be workable, although in a theoretical point of view it might be desirable. Whatever could tend to equalize the totality of charges is advantageous, and of course if amalgamation tends to equalize the total charges on all traffic, it would be desirable.

16,773. (*Chairman.*) You referred to the public

Mr. G. P. Bidder.

27 April 1866.

being prejudiced when companies were making agreements with one another; you were speaking not so much of amalgamations as of cases where companies which had been hostile were making agreements to work on friendly terms?—Perhaps they were not working even on friendly terms; they agreed thus far, that certain traffic should be divided, and that they would not traverse over the line of each other's territory or encourage subsidiary lines being constructed in any way. I say that is a state of things which ought not to be countenanced, and that wherever the Committee can drop on such an agreement they ought to put an end to it; in fact, it is taking the power of the Legislature into their own hands.

16,774. Do you recommend that some action should be taken by Parliament?—It is a very large district. With reference to the point suggested by Captain Galton, I think Parliament should take care of the continental route, because that is very important. The conditions under which the country is supplied with railway accommodation for the convenience of localities should be protected.

16,775. What precaution could you recommend Parliament should take to prevent companies discouraging lines that are required for the convenience of the country?—I think, in the first place, if those lines are *bonâ fide* supported by the landowners under the conditions I have already mentioned, that those companies should not only be prevented opposing them in Parliament, but I would compel them to work them if they had got the advantage of the amalgamation. There should be some rules with regard to laying out the line, and so on.

16,776. I understood you to say that before any amalgamation is sanctioned, Parliament ought to lay down some rules?—Yes.

16,777. Are those the rules you have just referred to?—That is the principle, of course I cannot, just on the spur of the moment, define the exact conditions.

16,778. (*Capt. Galton.*) What arrangements could you make to ensure that such a view of the case should be brought to the notice of the Committee before whom the Bill was placed that certain conditions should be made in the case of amalgamation, every amalgamation Bill being referred to different Committees?—You might have a set of clauses which should be enacted in all amalgamation Bills, and in the same way as you enact the railway clauses, the lands clauses, and the companies clauses, you might enact amalgamation clauses.

16,779. Make them certain standing orders, in fact?—Yes.

16,780. (*Chairman.*) Do you think amalgamations have generally been beneficial to the districts as well as to the railway companies themselves?—I think so.

16,781. (*Earl of Belmore.*) Allow me to ask you two or three questions with reference to the amalgamation of companies in Ireland. Do you think that it would be practicable, and at the same time advantageous to shareholders and to the public, to carry out something of this sort, to ascertain, by valuation, what the shares are really worth, and then to cancel all the existing shares, and to create new stock, giving so many shares to each individual as should be equal, not to the nominal, but to the ascertained real value of his property?—Yes.

16,782. If what I have suggested were to be done by means of a public Act of Parliament, and if Government were to make an advance of money to them, for the purpose of enabling them to discharge the floating debt, such advance to be repaid with interest by instalments, do you not think that Government might then fairly insist on a gradual reduction of fares and rates, in the interest of the public?—Government do not give any advantages; they might fairly stipulate for that. I think I should hesitate very much in making any advance in that way. My view rather is, that they should be all consolidated in one stock, and the existing companies entirely annihilated except so far as being in the receipt of a certain income.

16,783. How would you deal with the floating debts of the existing companies, which must be paid in some way or other?—Whatever floating debts there are, if they are paid, will be lessening the dividend, but the floating debts of the company, I take it, have scarcely any security, and therefore I think they should be paid in full, in cash.

16,784. Putting the floating debts out of the question, do you think, for the proper working of such a system of railways as I have mentioned, that it would be advisable to abolish all the present boards of directors, and to create a new board composed of experienced directors, sufficiently well paid, so as to enable them to give their whole time to the business?—That would be a great deal better than the existing system, which I suppose is as bad as can be. I do not believe in management at all, except the parties who have the management have a direct commercial interest in the result. If you pay them simply by salary, you cannot expect that gentlemen who are so paid will incur the same responsibility as they would do where they are interested in the result. It is a very serious thing for managers to recommend a reduction of the rates on railways, because if it eventuates in a loss they get blamed for it, and if it turns out favourable there is nothing more heard of it. Therefore, I say you never will have a railway worked to full advantage unless it is managed by those who have a direct interest in the commercial result.

16,785. Do you think it would be possible to obtain unpaid directors who could afford to give so much time as would be necessary to conduct the affairs of so large a system?—That is worse again. We have some claim on those who receive pay. You might drop on some gentlemen who for the love of the thing would do this work, but as a rule you cannot expect it. Unpaid directors would pay themselves in some way or another, either in the shape of patronage or in some other way. All directors are paid in this country, some more and some less, but the directors of this country have got a stake in the concern, and in the next place they are held in check by this circumstance, that at every half-yearly meeting, if the dividends are not kept up to the mark, there is sure to be a disturbance. If there were paid directors appointed by the State, I do not think you could reckon upon their managing a railway with commercial success.

16,786. I did not say that the paid directors were to be appointed by the State. What I would suggest is that they should be elected by the new company, and paid such salaries as should induce them to give their whole time and attention to managing the affairs of the company?—If all the railways in Ireland were amalgamated into one company, I should recommend them to pay their directors well. I should take care that the directors had an interest in the results.

16,787. Do you think so large a system as that would then have become, could be properly worked by a board of directors sitting in Dublin without the assistance of local committees elsewhere?—Yes, local committees have been a nuisance. It would be only in a smaller degree reproducing different boards of directors, who are always at variance one with another. The whole of the Irish railways could be worked with great ease and facility in Dublin, provided proper gentlemen were selected for the purpose.

16,788. You think on the whole it would be possible to consolidate all the railways of Ireland into one, and that when it was done it could be properly worked by one board sitting in Dublin?—I am certain of that, and much better than it is done at present.

16,789. (*Lord Stanley.*) What would you do in the case which I fear is not an infrequent one in Ireland, where a portion of the stock is unsaleable at any price, and therefore of no value whatever?—If the stock has no value, it really ought to have no value and I quite believe that to be the case in Ireland. I think many of the stocks are above their real value,

Of course you must put the proper value on it, and if it is worth nothing, you must put nothing on it. It is a strong measure, no doubt.

16,790. Do you think in that case it would be easy to bring the shareholders to accede to that view ?—It would be very difficult to bring the shareholders to take the view of the case that their shares are worth nothing.

16,791. I suppose you are not practically acquainted with the discussion which is now going on in Ireland with regard to the purchase of railways by the State ?—No, I am not.

16,792. You cannot say whether the idea is or is not that they will obtain a great deal more than the market value for their stock ?—No.

16,793. (*Chairman.*) With respect to the question of working railways by limited liability companies, do you think that that is desirable, if it can be effected, in England ?—Yes, and in Ireland too.

16,794. Do you see any means by which, supposing it was considered desirable, it could be effected ?—I think there would be no difficulty in effecting it. What I understand to be the objection taken to it is this, that if they were sub-let to a company under a contract, the rolling stock and permanent way would not be kept up. There is no difficulty at all about that. I have had great experience as regards the more difficult department, that of the rolling stock. The North Staffordshire Railway is worked under a contract which I made in 1849 for 10 years.* It was so framed that the contractor's direct interest was in improving the stock, and the stock was of more value when he left it than when he took it. The permanent way can be laid under similar conditions, so that it could be made to the direct interest of the parties who are working it to improve rather than allow the rolling stock to deteriorate. It was done in this way in North Staffordshire. With every engine and every carriage an account is opened. With respect to No. 1 engine its value is put down at the price paid for it, say 2,500*l.* The contractor is paid 1*s.* 1*d.* per train mile, but out of that 1*s.* 1*d.* the company kept back 1½*d.* mileage rate. The contractor said, "Hand me over "a sum to the credit of that engine, because I have "put a new engine on the line;" and he sells the old engine if he thinks fit. The best of it is this, that whenever the money reached a large amount, it was for the advantage of the parties to put a new engine on the line and have the use of it, rather than to continue the use of a partially worn out engine. So in the same way with regard to permanent way. The contract should be that for every train mile run you made a deduction going to the credit of the permanent way, which was only to be taken out by the contractor relaying it with new rails and new sleepers. It is perfectly obvious it would be to the interest of the contractor to keep the road in good order rather than have to work over an imperfect road. You have this direct advantage, that it would be worked by a commercial firm, who, not being responsible to any one but themselves for the result, would try to earn greater experience in such matters than I believe any ordinary body of railway directors generally do.

16,795. (*Capt. Galton.*) As the company would be much smaller, they would not have the same number of shareholders ?—Only eight or nine; not more than 10 or 12 at most.

16,796. The capital would be small ?—If there were a small number of persons, they would be responsible men, and responsible for a large sum of money.

16,797. Suppose you take the Great Western Company ?—A limited company should not take that at less than a million of money, and half a million of money should be paid down. That is wanted for trade purposes.

16,798. (*Chairman.*) Could you bring such an arrangement into operation ?—Of course, if it was understood that the Legislature would view it favourably, it might be left simply to companies, which should have the power of sub-letting to themselves, upon such conditions and such general terms as should be approved of by somebody to be appointed to see that the conditions of the contract are such as would uphold the rolling stock, and prevent the stock falling into disorder, and that it was adequately managed.

16,799. (*Capt. Galton.*) You would leave any railway company to do that without parliamentary sanction ?—They should be subject to general conditions.

16,800. You would make a general Act with reference to it ?—I would take care that the conditions annexed to the contract were such that the stock must be upheld.

16,801. (*Chairman.*) Have you ever seen any symptoms of an indisposition on the part of railway companies to make such arrangements ?—No; I have not. They have never considered it a thing likely to come about. I dare say it would take some time, even if any powers were granted. It is hardly ripe for it.

16,802. (*Capt. Galton.*) You assume it will be of advantage to the company by enabling them to secure a higher permanent rate of interest than it now gets ?—Yes. Another objection to it is that it would not be to their interest towards the termination of their lease to cultivate their traffic. I suggest that an increase of traffic should be capitalized in a certain proportion.

16,803. That is, to pay them back ?—No. Supposing the increase of the net revenue was 50,000*l.* a year, I should propose that a portion of that should be capitalized and handed over to them at the expiration of their lease; that will recoup them for any risk they run in developing it.

16,804. You were referring to the North Staffordshire contract, can you hand that in ?—Yes. (*Vide Appendix.*)

16,805. (*Chairman.*) The more enterprising a company is, the greater is the reduction of their fares ?—I think it will go on with regard to the passengers, certainly; but as regards general merchandise I believe you may leave that safely to the railways.

16,806. Do you think there is any reason to suppose that a small number of persons composing a limited company would advance more rapidly in that direction than those enterprizing railways ?—Yes; I think so. I think it is more owing to the national elasticity of the traffic of the districts they serve than to any peculiar management that I see.

16,807. Have you a very strong opinion that a lowering of the fares and charges on goods would be remunerative to the companies ?—Certainly; within limits, of course.

16,808. (*Mr. Horsfall.*) What limits; take, for instance, a large railway company like the North-western ?—I think, as regards all articles of value or general merchandise and perishable articles, we may leave that to the railway companies. It is impossible that any one can fix a rate; we must leave that, of course, to their good sense to fix a rate which would bring them the most revenue. But I do think that where anything could be done for the public by lowering the rates on heavy articles it should be done; that, I believe, would be of great importance to the railways and certain large districts of the country.

16,809. And to passengers ?—And also the cheap class of passengers. I think we want a cheaper class than we have now. I think workmen with their families should be able to be transported from some of the rural districts at a very low rate.

16,810. Do you not think that a considerable reduction might be made in the first-class fares without injuring the company but benefiting the public ?—In some cases. To what extent they could be reduced with advantage to the companies I cannot say if it can be done. I think it might be left to the natural course of things that it will be done.

16,811. (*Chairman.*) You think a limited company

* See Appendix CL.

Mr. G. P. Bidder.

27 April 1866.

would be inclined to make experiments more rapidly than the present railway companies?—Yes, I do. If it is likely to be advantageous, a limited company would find it out sooner, and they would not mind trying the experiment of going back again; they would not mind running the risk of public observation.

16,812. There are some companies that are in very few hands?—I dare say there are.

16,813. Do you know whether those companies have been willing to act more liberally than large companies?—I do not know. I do not know of any company where it is really limited to some 9 or 10 individuals. If I were to embark in one, I would not have more than eight or nine partners.

16,814. Would you prevent the shareholders in that limited company from parting with their shares?—I should leave that entirely to themselves.

16,815. There would be no security that in a short time that company would not consist of 20 or 30?—That you cannot help. You might limit it that the company should be restricted to 9 or 10 or 12 partners, but each of those gentlemen might represent half a dozen more.

16,816. With respect to running powers do you recommend any alterations or changes?—My opinion is, that they should be universal.

16,817. (*Lord Stanley.*) You mean that every company should be allowed to run over another company's line?—I would let traffic come to them in all directions. The only limit I would put on it would be this; I should not allow a company to use another company's line merely for three or four miles at such rates as they chose. A company having traffic which they wish to send on to another line where it might run for 100 miles, running on their own line for merely four, it would not be fair that they should fix the rate for those 100 miles, but wherever a company have a fixed interest in the traffic I would let them have running powers.

16,818. (*Capt. Galton.*) How would you fix the rates?—I would let them fix the rates, only the rates must be applicable to the two companies. Running powers mean this, that I should have the power of fixing my own rate.

16,819. For instance, suppose you have a line coming to join the North-western at about 10 miles from London, and you run in over that most crowded part of the North-western line into London, and fix a rate which, perhaps, would amply remunerate you on your less expensive and less crowded line, but which the North-western might demur to, as not being sufficient to pay for their extra expensive line?—If their traffic is crowded your traffic would be subject to their regulations. Although it is an expensive line it is a very large company. I say the fares have nothing to do with the cost of the line; of course I put a limit to anything of the kind which you have mentioned of a company coming on the North-western upon the last 10 miles into London, I think that would be unfair under any circumstances.

16,820. How would you limit the arrangement?—I could not say at once; but what is floating in my mind is this: that where there is a company who have got a traffic of 60 or 70 miles on their own line, wishing to send it over 80 or 100 miles of another company's line, they should have the power, if the other company would not take in their traffic upon ordinary terms, of having it settled by arbitration. You must provide your own appliances for your engine, you must have the shops for cleaning it and doing any temporary repairs, although you can claim from the other company, upon payment, the use of its water crane and any other accommodation of that sort which is necessary to be provided for the engine generally. I think through rates, in some way or other, should be obtainable in every direction upon fair terms.

16,821. (*Chairman.*) When one company has running powers over another, has it the power of stopping at all the stations of the other company?—If they have running powers they have power to deliver and take traffic to any of the stations on that line, but they cannot take up local traffic. For instance, suppose I have got a line from London to Peterborough, if they have got running powers they can exercise them if they choose from Peterborough to Doncaster, they can take traffic to any of the stations between Peterborough and Doncaster; but they cannot take up traffic on the Great Northern to deliver at intermediate places.

16,822. (*Earl of Belmore.*) The Midland are somewhat in that position now with regard to the Great Northern in getting into London, are they not? Possibly they may be, but that is not within my knowledge.

16,823. Practically they would not in most cases carry passengers except to important stations?—Where it would be chiefly exercised would be with regard to goods, especially with regard to minerals.

16,824. Do you find an unwillingness on the part of any company to book through?—I have not experienced it; but I daresay there may be cases of that sort.

16,825. I think the general tendency of the evidence has been that through booking arrangements are much more frequent now than they were a few years ago?—Yes.

16,826. As matters at present stand there is every probability that through booking arrangements will go on?—Yes.

16,827. Do you think it is desirable that Parliament should interfere by making any general regulations granting every company running powers?—I think if it were left to me I should do it and take the consequences. Wherever I have any control I have always said, throw the railways open. What influences managers is no doubt this, that if we have got the traffic, for instance from a place from *a* to *b*, we get the whole mileage. For the sake of illustration I put it in this way; we have got 30 miles of rate, if we allow the traffic of another company to intercept it, instead of 30 miles of rate we shall only get 20, and therefore we lose 10 miles. The policy of managers is to get the longest mileage out of the traffic. The view I take of it is this, that although the public have the benefit of the best route that can be given, and although you get more out of the traffic, if you keep it on your own line my opinion is that in most cases they would be much more than paid by the increase of traffic owing to the facilities that are given to it. I believe on the whole that, taking it as a general rule, railways would be more compensated by any increase of traffic than any loss they would sustain by diverting it entirely off their own system.

16,828. Would not the prospect of acquiring running powers as a matter of right give a great additional value to small companies whose lines were running into the lines of some of the larger companies?—No doubt it would to those who cannot approach except through main lines, which are inimicable to such a connexion.

16,829. Would that be fair to the larger companies?—Quite fair. I will take the Furness Company, who are surrounded by the Lancashire and Yorkshire, and all the rest of them are in contact with it.

16,830. The North-western and the Midland come in contact with it?—Suppose, by possibility, the Lancashire and Yorkshire Company have traffic which they have forwarded for your convenience, but these two companies, seeing that they can get traffic in some other directions which pays them better, will not concur. The Lancashire and Yorkshire is surely to have access to your system, and should be able to compel an access if the other companies will not give it to them. If they must give the company over which they exercise it the same rate as they take themselves, that will not be a great hardship, and will prevent injustice in most cases, probably in the great majority.

16,831. They must give the same rate in all cases as they take themselves?—They must do it.

16,832. Is it not usual when running powers are

exercised, for the rates to be fixed by arbitration ?—Not running powers; of course you may have running powers with accommodation, such as through rates. That may or may not be of any use in order to make that valuable; I think through rates should be established and made until the arbitration is concluded, and then the arbitration will be quiet, prompt, and summary; whereas if you go to the managers and squabble over the rate for a twelvemonth, and the public are deprived of the advantage.

16,833. Do you think it is desirable that any Board of Appeal should be constituted for deciding questions between different companies ?—I think so.

16,834. How would you constitute such a board ? I think it should be done in this way : I think if you could obtain it there should be one great judicial authority; I think the importance of the case really demands it, and then in any case of difference he should be aided by two assessors, to be named by the contending parties. Of course I do not mean that he should be troubled with every little pettifogging complaint, but when the questions are large I think that will be a tribunal which will administer justice, and will enable the public convenience to be forwarded by facilitating the establishment of through rates and through booking.

16,835. (*Capt. Galton.*) Would you make that tribunal decide questions between the public and railway companies ?—Certainly.

16,836. Or merely questions between railway companies ?—I think if you had such an authority you might apply that to all questions.

16,837. Your principal point in it would be to establish a tribunal to arbitrate between railway companies themselves ?—Yes. For instance, suppose the Great Eastern wanted to forward traffic to the north, at present we have no power to compel that. We fix a rate and we send the traffic. Mr. Seymour Clarke would object, we should then have this tribunal to appeal to. They would appoint an assessor, and we should appoint one, to aid in practical questions the judgment of the Court or the ultimate arbitrator, or whoever should be appointed. You did appoint an arbitrator in land compensation cases at the Board of Trade, but I should select a much higher authority for these questions.

16,838. (*Mr. Horsfall.*) Still you think it desirable that that should also be a court of appeal as between the traders and the railway company ?—Yes; they are generally very small questions. He should have authority to appoint some gentleman who should investigate it. They would generally be very simple questions which could be settled by going to the station where the complaint lies. The matter of fact would be ascertained publicly, and he would be able to adjudicate upon it.

16,839. In point of fact, would you take all disputes arising out of railway traffice in any way from the ordinary courts and refer them to this special tribunal ? —What I think is desirable is that there should be a railway tribunal for all railway questions, the same as you have a judge for the Divorce Court. Railways are of a character which justify a special tribunal, and a judge whose special duty it is to decide such questions would, in my opinion, be a very competent tribunal.

16,840. (*Lord Stanley.*) Is there not this objection to the appointment of a single judge to deal permanently with one class of questions; being, as the judges in England are practically irresponsible for error, is there not this danger, that the errors of such a judge exercising an enormous and arbitrary discretion would become embodied in the administration of the law ?—I do not think there would be, if he decided merely great questions.

16,841. I am putting it in this way, if one of the judges of the County Courts decides erroneously, that decision is not followed by other judges, and does not form part of the law of the land, and so with the judges who go on the circuit; but if you have a single judge confined to dealing with one subject and he takes a particular view, confining himself to dealing with one particular class of questions which shall be decided by him, there is no other court or authority to overrule him or to correct all these decisions ? —Yes, no doubt that is subject to this observation. The only suggestion one can make with regard to it is that his decisions should be subject to appeal. I can suggest no other course; but I know it is very desirable that we should have some high judicial authority specially applicable to railway companies. Anything is better than at present; nothing can be worse. Take the appeal to juries in compensation cases. We know perfectly well what the result is before we go; but it is a matter of duty; it is, as it were, to resist exaction; but we know what the result will be.

16,842. (*Chairman.*) Supposing such a judge were appointed should you propose that cases should be referred to him for decision which cannot at present be actually carried before any court ?—Yes, such as the case with through booking and forwarding traffic.

16,843. Then he would not have to decide on strict matters of law ?—No, not as regards those cases.

16,844. He would be more in the nature of an arbitrator than a judge ?—Yes.

16,845. Does it frequently happen that railway companies go to law with one another ?—Yes, they do go to law with one another, but not upon such questions.

16,846. Is there any difficulty at present in their agreeing in any serious matter to appoint arbitrators and abide by their decisions ?—There is no difficulty in that, but they do not do it.

16,847. Is it the fact that they do not ?—The cases which particularly apply to arbitration are so contrary that people do not attempt it, and they do not even ask it.

16,848. Have you any additional observations which you wish to make with respect to the interchange of traffic between neighbouring railways ?—No, excepting what I have already stated, namely, that the traffic should be at all times to follow upon the responsibility of the company who seeks to forward it, and other companies should be compelled to take it upon such terms as they charge currently; but that if they think the charge is improper and not applicable to this case, then that they should have an arbitration in the way that I have suggested.*

16,849. Your opinion is that general running powers should be conceded ?—Yes.

16,850. That would secure in all cases the forwarding of traffic between neighbouring railways ?—Yes.

16,851. Do you think that the law is at present in a satisfactory condition with respect to parochial rating ?—Nothing can be worse. The law can only be applied by almost a perversion of it. My attention has been more particularly directed to this. Of course what is passed cannot be recalled; but rating has been a very heavy charge upon railways, and it is only of partial advantage, namely, to the parish through which the railway passes.

16,852. How do you mean only a partial advantage ? —I mean advantage to the parish which is intersected. They pay a large amount of rates, which makes a heavy charge upon the railway. Of course originally the Legislature might have increased the Government duty upon railways, and have relieved the railways from this charge which is so partially distributed, and where nothing is done towards earning it. Of course the parishes should not have been subjected to any loss, that is to say, the value of the property which has been taken or destroyed by railways should be charged on railways. Of course you cannot interfere with the present state of things, because the property in the districts has been sold and changed hands under the existing law. I suppose that the general amount of the rating of railways cannot be less than half or three-quarters of a million per annum. I think you ought to restrict the amount to

* See alteration and explanation of this answer in question

Mr. G. P. Bidder.
27 April 1866.

its present limits, and to exact corresponding advantages for the public. At all events the evil of that should rest at its present stage. It is a very heavy source of legal expense to railway companies, because every now and then the parish raises the rates and it occasions a very heavy expenditure in resisting the parochial assessments.

16,853. Do you think railway companies ought not to be rated for more than the agricultural value of the land that they occupy?—I cannot say, but then I think that that remission should have been secured by the State. I do not mean to say that railways should not pay as much as they do now, but the payments should go to the State, because the parish do nothing towards earning the money. The railways have no charge corresponding to the rate they pay.

16,854. Is there any general principle by which the value of the railway for rating purposes can be ascertained ?—They profess to go upon this, what would the railway let to a yearly tenant for? Of course nobody could bring a tenant to it, they arrive at it in this way, they take the earnings of the railway, and divide the mileage, and say that is the gross earning in this parish, then they say that is subject to the current working expenses. Then there would be the statutable deduction and trade capital, then there is always a great dispute over the renewal.

16,855. (*Lord Stanley.*) It is a very complicated case, and the result is not satisfactory?—It is most unfair on both sides. Some railways are not assessed at all that ought to be assessed, and there are large payments made to the parishes which really have done nothing towards earning it, whereas I say that payment should go to the State.

16,856. You think it is right that railway companies should pay a certain contribution to the State if not to the parish?—If they pay it at all it should go to the State. As it is the law which renders them liable, I should say as the State gives them that value the State should have the benefit of it.

16,857. Do you mean if the railway takes a considerable part of the land of the parish that it ought not to be liable to pay any of the burdens of that land?—They should be liable for the rates of the property they take, they should not be liable for the rates beyond that.

16,858. You think that the land should be valued either as agricultural land if it is in an agricultural parish, or as building land if it is in a town, and the rate be made accordingly?—Yes.

16,859. (*Chairman.*) Do you know what is the case with respect to canals; are they rated in the same way as railways?—I have never had to deal with canal cases.

16,860. (*Capt. Galton.*) Are docks rated?—Yes.

16,861. In the same way?—Whether the same mode is adopted for fixing the rates I cannot tell.

16,862. (*Chairman.*) You think that the present system of compensation for injuries to passengers is unjust upon railway companies?—Yes, I think it is very unjust.

16,863. What alteration would you recommend?—I do not suppose that you can alter the law; I do not anticipate that the least in the world. I had some discussion three or four years ago upon this subject with a view of putting it on another basis. As you are aware the whole question is taken to a jury; there is a Board of Trade inquiry also upon the accident; neither of which is at all satisfactory. What occurs to me would be this, that the injustice at present is obvious, there is no consideration paid to the railway corresponding with the liability they incur. A man earning 5,000*l.* a year, and a man earning 50*l.* a year may be paying the same fares, and yet the liability of the company is very different. I think, in the first place, everyone travelling should be charged an insurance rate, whatever their value might be, and then that insurance should not be more than half the risk that is incurred, that is, you should ascertain as well as you can from experience up to this period what the risk would be, and halve it, so that the public would only pay half, and the other half should be borne by the railways. For that purpose the whole of the railways should be represented by half a dozen trustees, or directors, or whatever you choose to call them, who should administer this fund, and that the difference between the payment received and the sum awarded or insured should be a contribution from all the railways according to their capital or their value; and then this Board should have the power of inquiring into, and should also have the power of correcting any defects that could be proved to have arisen that contributed to the accident. The advantage of that would be this, that you would have an inquiry conducted by gentlemen who would have the best practical advice, namely, their own managers or superintendents, and you would have them directly interested in according the best management. You would also have this further advantage, that everything they ordered would be what they would have to do themselves on their own lines, and there would be no complaint made that anything had been capriciously or vexatiously exacted.

16,864. Would you make a certain addition to every fare?—Yes; if a man chose to go in for a claim, and say that he valued himself at 50,000*l.* or 100,000*l.*, he would have to pay his 2*d.*, or 3*d.*, or 4*d.* additional as the half risk; then, beyond that, I would also have this, that if a man chose to declare so much for third class, or second class, or first class, that he should pay a certain sum.

16,865. (*Capt. Galton.*) You would make him pay that as a fixed amount, irrespective of the value that he might be?—Yes; if a man wanted more he must declare his value, that is, for death. The only difficulty that I do not see my way through is compensation for injury; the compensation for injury to a man may be more than what would be paid to his relatives if he were destroyed. Up to the question of death there is no difficulty at all in dealing with it.

16,866. If the compensation for injury were not limited he might receive the maximum amount which his relatives would have received if he had been killed?—I am afraid you cannot do that.

16,867. (*Chairman.*) I suppose cases of injury are 20 or 30 times as numerous as cases of loss of life?—Yes, but accidents which result in very serious compensation I do not think are very numerous.

16,868. But still they are numerous enough to make them a very serious burthen on railway companies?—No, they are not so numerous as the cases of death. We had a case on the Harwich line where a gentleman was damaged. He was a teacher on board the *Britannia*, and had a salary of 400*l.* a year. The jury awarded him 8,000*l.*, so that he got the 400*l.* a year and had that capitalized at his death. That is clearly very unfair. The company proposed to secure him his 400*l.* a year, but he refused that. There is no doubt that he was entitled to substantial compensation.

16,869. Have you considered how much you think the fixed amount ought to be for the third class?—I think about 100*l.*, 200*l.* for the second class, and 300*l.* for the first class.

16,870. (*Capt. Galton.*) You would give everybody an option of insuring to any amount they liked beyond that?—Yes.

16,871. Do you propose that there should be facilities for insuring at all railway stations?—Yes, all the railway companies should be compelled to do it. If a gentleman were to say, "I am going in for 50,000*l.*; "what is your rate?" he would be told what the rate is. By this course you get rid of all those questions as to whether the company are liable in the first instance, because in the first place you have to prove the accident is from the negligence of the company or their officers, if you cannot prove that the claim fails. I would do away with all questions, and pay the money instantly the accident occurs; the man is dead and the money must be paid, and then an inquiry as to the cause of the accident, and what can be done to

prevent it for the future, I think ought to be remitted to the sort of tribunal I have indicated.

16,872. Do you propose that the insurance should be for each separate journey, or that a passenger might insure himself for life?—He might do it for both. A gentleman comes to the Rock Insurance Office and says, I have no present intention of going abroad, but I wish to have the option of going abroad at any time during my life, within what is called "all the world policy," and they give it to him on paying 10*s.* per cent. He pays the 10*s.* per cent. and that gives him absolute liberty of going to all the rest of the world.

16,873. Would you propose that any passenger when he goes for his ticket should be allowed in addition to insure himself for any amount he might think proper?—Yes.

Mr. G. P. Bidder.

27 April 1866.

16,874. Would not that entail at crowded stations a great deal of additional trouble?—No, there would be a ticket.

16,875. (*Capt. Galton.*) There would be an insured ticket and a non-insured ticket?—Yes. The clerk might take the 1,000*l.* insured tickets out of one box and he might have another box in which there might be insured tickets for 20,000*l.* or 1,000*l.* as the case might be.

16,876. The ticket might be lost if he were killed?—That is possible.

Adjourned till Thursday next at 2 o'clock.

Thursday, 3rd May 1866.

PRESENT:

THE RIGHT HON. THE EARL OF BELMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
GEO. CARR GLYN, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

MR. JAMES ALLPORT further examined.

Mr. J. Allport.

3 May 1866.

16,877. (*Chairman.*) Have you been furnished with a copy of the evidence of Mr. Cosgrove given before this Commission a few weeks ago?—Yes.

16,878. Have you any explanation to give of the transactions which form the ground-work of his complaint on behalf of the brewers of Burton?—I have. I think Mr. Cosgrove first goes into the history of certain agreements, and it will be perhaps better to clear up that first. Those agreements originated at first with two exclusive ones which were made with Messrs. Bass and Allsopp's in the year I think of 1852.

16,879. Those are not referred to in Mr. Cosgrove's evidence I think?—No; but that was the origin of those agreements; those agreements were not made by the Midland Company, although the Midland was then the only railway there; they were made by the London and North-western Company. We have always stated from that time to the present that we would make no agreement with one brewer that we did not make with the whole, and any allowance that was made to the larger brewers would be made to the small ones. Those agreements were for seven years, and they were carried out, we allowed ultimately the same drawback to the small brewers as to the large ones in the year 1859. This agreement, which is the one complained of by Mr. Cosgrove, was made between the London and North-western Company and Messrs. Allsopp. That we knew nothing at all about, excepting the mere fact that the agreement was made. We never could obtain a copy of it, or a sight of it in any way whatever until the autumn of 1864. When we heard of the agreement being made we immediately waited upon Messrs. Bass & Company and most of the other brewers, and entered into the agreements which are alluded to in Mr. Cosgrove's evidence.

16,880. There are some agreements referred to in his evidence as having been made in 1861?—Yes; those are what I alluded to. In 1859 an agreement was made with Messrs. Allsopp, and in 1861 an agreement was made with us; but the autumn of 1864 was the first time that we knew the terms of Messrs. Allsopp's agreement. In the agreement of 1861 we felt and stipulated that they should be put on the same terms as any other brewers in Burton, and as far as we could we have from time to time done so; but Mr. Cosgrove in his evidence states from high authority that we knew from the commencement the terms of the agreement.

16,881. (*Mr. Glyn.*) That is, of the agreement of 1859?—Yes; he goes on in two or three places to state, and he did it on high authority, that the Midland Company knew of this agreement from the commencement. I am a good deal surprised at that statement, because from time to time correspondence has taken place and interviews have been held upon the subject. I have myself seen various members of the firm of Bass & Company, and told them that the moment we knew what the agreement was, they should have the benefit of it. Only so late as the 15th September 1864 I wrote to Messrs. Bass & Company to this effect, "We have not yet received a copy of the agreement "between the London and North-western Company "and Messrs. Allsopp, but we expect that we shall "have it in a few days." We had been urging upon the London and North-western Company the necessity of supplying us with this agreement, but we never succeeded in getting it. The first time we received the agreement was late in the autumn of 1864, and of course even down to this moment we are under the restriction as to its privacy which is put upon this agreement by the London and North-western Company; it was handed to Mr. Walklate with the understanding that the information was for the present for the private use of the Midland Company only. I merely mention this of course, the London and North-western Company have a perfect right to make those agreements, and not furnish other companies with copies of them; but the whole of this was in the knowledge of Messrs. Bass & Company and the other brewers, as is shown by my letter of September 15th, 1864. When we received the agreement I immediately wrote to them to say that I had received it, and that when I had fully looked into the terms of it I would then examine all the accounts and make them a drawback; but I found that there was a supplementary agreement.

16,882. What were the dates of those agreements?—Those were dated in April 1864, of which agreements I did not get copies until the 29th March 1866, a month ago, so that it is only within a recent period that we have been in full possession of the terms upon which Messrs. Allsopp's agreement with the London and North-western Company was based, and that we have had an opportunity of putting the brewers on the same footing. But to show that the brewers have not suffered any loss from this, I may mention that when we found in 1864 that we could not get at the exact terms of the agreement, we allowed them to keep back their accounts to the extent of some 40,000*l.* or 50,000*l.*, so that they should have the money in hand, and it would be merely a question of account when the terms were known. So far as the Midland Company are concerned in this matter we have always refused, even at the instigation of the large brewers, and it has been a source of some

Mr. J. Allport.
3 May 1866.

annoyance to them from time to time, that we, the Midland, have always refused to give them advantages over the smaller brewer; but it is a principle that has influenced the Midland Board for many years, that no advantage should be given to a large trader over a smaller one, and there is no firm I am quite sure trading upon the Midland Railway who are better acquainted with that policy than Messrs. Bass & Company. I can only assume that these incorrect statements, to use the mildest terms, were made in consequence of Mr. Cosgrove having only recently joined Messrs. Bass & Company. He was formerly a station-master I believe on the London and North-western Railway; he has been in the service of Messrs. Bass & Company for only a short time, and can scarcely have become acquainted with all that has transpired from time to time during the last 15 or 20 years as to these Burton matters. I think it is a pity he did not make himself more fully acquainted with them before he allowed himself to make such statements.

16,883. (*Chairman.*) Mr. Cosgrove speaks not only on behalf of Messrs. Bass, but of a number of other small brewers and companies at Burton?—Yes, that is perfectly true, but they were all perfectly well acquainted with the subject. If you observe the statement is signed by the other brewers, and it does not go to anything like the extent that Mr. Cosgrove's evidence does. His evidence is very much stronger, and goes far beyond it.

16,884. Mr. Cosgrove put in what are called "over-charge sheets," and I see that some of them are dated as early as January 1863. Would not the fact of those over-charge sheets being in the possession of the Midland Company show them what the nature of the agreement was with the London and North-western Company?—That is one of the points I am coming to, and it is precisely one of the charges which I have to make against Mr. Cosgrove, for it is an unfair and, in fact, an inaccurate statement.

16,885. (*Mr. Glyn.*) Have you observed that in answer to one of the questions put to him, he says that in point of fact you must have known it, because you had the over-charge sheets?—Yes; he says in his statement, "We have it on high authority "that the Midland Company knew all along the "scale of rates according to which Messrs. Allsopp "& Sons were paying the London and North-"western Railway Company." I will first explain to the Commission how the business was done. Before the London and North-western Company had their own establishment at Burton we did their work, and the goods were invoiced at the same rate as to every other brewer; then the London and North-western Company sent those over-charge sheets not to us, not for our direction or information, but to Messrs. Allsopp. After that, occasionally they would accidentally come into our possession, and the whole list of over-charge sheets that have ever come into our possession I have now by me; and there is a list out of all the rates which are included in their list of rates to Messrs. Allsopp, which consists of over 14 pages. We have only received over-charge sheets from 22 places, and we commenced making a list of them. We thought that by degrees we should ascertain exactly what rates were being charged, but most of them were very unimportant places. There is Beeston, Wimslow, Dunstable, Wolverhampton, Bordigan, Mostyn, Acton, Berkhampstead, Atherston, and other small places. There is only one or two important places: there is Oxford, Dublin, Chester, Northampton, and Dudley.

16,886. The London sheets are not included in that list, are they?—No, nor a tenth part, nor a twentieth part of the stations to which the traffic was sent. This is the list that we commenced to make out, but the London and North-western Company's agents finding that those sheets were occasionally getting into our possession, took steps to prevent it, and for the last four years certainly we have not had a single over-charge come into our possession, until recently when the two companies have now settled matters between them, and we have now all those over-charge sheets to go through with the London and North-western Company, and to settle with the various brewers. So far from the Midland Company having any knowledge of those over-charge sheets beyond what I have stated, we did all in our power to get them, for they would have enabled us to make an allowance to other brewers.

16,887. (*Chairman.*) Were the over-charge sheets sent regularly to those 24 places which you mentioned, or only an overcharge sheet occasionally?—I presume they were always sent.

16,888. Were they sent regularly to those different stations?—No; I will assume that we were charging 20*s.* a ton for ales from Burton to Liverpool, or from Burton to Ireland, and that the London and North-western Company agreed to charge 15*s.* We should charge Messrs. Allsopp's the same, and we should insist upon the payment of that amount; they always did pay us up to a certain time. Then the London and North-western Company would send those over-charge sheets from Liverpool to Messrs. Allsopp's, showing that the ale charged on such a day 20*s.* should be 15*s.*, the allowance being 5*s.*, that was to enable Messrs. Allsopp & Company to recover, or make out an account against the London and North-western Company for these over-charges, so that we had nothing to do with them; we merely invoiced the goods in the usual way; we charged Messrs. Allsopp the carriage and were paid; the London and North-western Company received from us their mileage proportion of the higher rate, and then the London and North-western Company allowed Messrs. Allsopps the drawback without our knowledge.

16,889. Was the whole abatement made by the London and North-western Company?—Entirely.

16,890. Did the Midland Company have no part of the abatement to make?—None whatever.

16,891. They received their full rate?—Yes. But when we made this arrangement with Messrs. Bass we said, We will put you on the same footing as Messrs. Allsopp. When we know the terms of the agreement you shall have the benefit of them, and then we will arrange with the London and North-western Company. We said to the North-western Company we shall send to your stations from Messrs. Bass and other brewers, and you send to our stations from Messrs. Allsopp. Let us have a general settlement, and whatever you allow to Messrs. Allsopp we will allow our proportion, and so on.

16,892. (*Mr. Glyn.*) During the time that Messrs. Bass & Company allege that they ought to have received a certain allowance from you, you were not, in point of fact, receiving from the London and North-western Company a diminished rate at all?—Not at all. In fact, we wanted to make an allowance; we should have been too glad to do it. These accounts, running over so many years, have become so voluminous that it will take us now, with three or four clerks, several months to get these matters properly adjusted. We were anxious to get them settled at the time, and should have got them settled could we have known the terms of Allsopp's agreement.

16,893. (*Earl of Belmore.*) What was the object of the London and North-western Company in keeping those agreements from your knowledge?—I can quite understand that when the London and North-western Company came to Burton of course they wished to get into favour with the Burton brewers, in order to get all the traffic they could. They made this agreement with Messrs. Allsopp, and they said to the other brewers, If you will be prepared to enter into the same agreement with us as Messrs. Allsopp have you shall have the same terms; we will not show you the terms until you say that you will enter into the agreement. A very proper and legitimate position for the London and North-western Company to take. It was not with a view to charge one brewer higher rates than another, but to get the traffic. But we neutralized that by immediately going to all

the brewers and saying, Do not make these agreements with the London and North-western Company, but whenever we find out what the agreement is you shall have the benefit of it.

16,894. (*Mr. Glyn.*) Is it not possible that Messrs. Allsopp might wish to have it kept secret?—No doubt of it. I should fancy they had the greatest interest in keeping it quiet, because they had for a time an opportunity of underselling all their neighbours.

16,895. (*Chairman.*) You were aware all the time that you would have to refund a considerable sum to Messrs. Bass and other brewers from the rates actually charged?—From 1859. I knew of the agreement being signed within a few weeks of its accomplishment, and I immediately myself informed not only Messrs. Bass but all the brewers. I went down to Burton and went round and told all the brewers that the agreement was signed, and if they would not make a single agreement that they should have the benefit of that agreement as soon as we found it out. I believe I am correct in saying that the agreement with Messrs. Allsopp is the only agreement that the London and North-western Company have been able to make. There is no pretence whatever for the brewers saying that we knew this, and kept it back in order to charge higher rates; we have allowed every brewer in Burton to keep back sufficient money to cover all those allowances when they become known.

16,896. (*Mr. Glyn.*) Were there not certain advantages held out to Messrs. Allsopp & Company in that agreement as to having access to the West India Dock for their shipping trade?—I think not. Of course we were both in the same position as to that; we both had access to the West India Docks. While upon the subject of these agreements I would say this: The London and North-western Company run over the Midland Railway for six miles from Wichnor to Burton; they have no parliamentary powers, but we gave them running powers, and they pay us certain tolls; they fix their own charges and pay us a certain toll for the six miles they run over. For what purpose I do not quite understand, but Mr. Cosgrove has failed to give this information that, in addition to the agreement he has named, in 1863 I had an interview, on the 19th May, with three or four members of the firm of Bass & Company, and a further agreement was entered into, the one of 1861 being for six years, and that of the 19th May 1863 for 21 years, and there is one clause to this effect; "No "advance to be made upon existing rates, and any "reductions which may during the term of this "agreement be made by any other railway route, "Messrs. Bass & Company's rates to be reduced to "the same amounts." This question of the London and North-western agreement with Messrs. Allsopp was most fully discussed with a partner of Messrs. Bass & Company at the time, and I am quite sure that there is not a member of the firm who is not thoroughly convinced that we were not acquainted with the agreement with Messrs. Allsopp. To show the importance of the agreement of 1863, I may mention to the Commission, that it provides that we shall build them extensive premises in London, and we have in fact expended about 150,000*l.* or 160,000*l.* in one single warehouse for Messrs. Bass in London. We have also expended upon the Burton branches exclusively for the accommodation of brewers, I think about 130,000*l.*, to enable the brewers to get upon the line, and to save them the expense of cartage.

16,897. (*Earl of Belmore.*) Are all those short tramways that run into their premises your property or theirs?—I have brought here a map of Burton, which was published by a gentleman residing there, which shows the precise position of matters at Burton (*handing in the same and explaining it to the Commission*). Part of the terms of the agreement of Messrs. Allsopp with the London and North-western Company is that they should be allowed 4½*d.* per ton for taking the traffic over those private branches of Messrs. Allsopp & Company into the London and North-western station, and not an unreasonable allowance, considering the expense of those branches. Messrs. Bass & Company have still considered that a great hardship, that we refuse to allow them 4½*d.*; but we say, you have merely made a small connecting tramway to join our main line, but Messrs. Allsopp have incurred in their own case the cost of these private branches, and it is manifestly unfair to call upon us, not only to be at the expense of branches costing 130,000*l.*, but to allow you 4½*d.* per ton because we have made them.

16,898. (*Mr. Glyn.*) 4½*d.* per ton is a toll over the branches?—Yes; it is a toll over those branches.

16,899. (*Capt. Galton.*) In fact you contend that as Messrs. Allsopp paid for the construction of certain lines to join the Midland line, the London and North-western Company therefore are fairly entitled to get some rebate from the price you charge Messrs. Bass, who have not made any such lines, but left you to make them?—We say that as Messrs. Allsopp & Company have made the branches from their works to the North-western station, they are entitled to the allowance of 4½*d.* per ton for the use of those branches.

16,900. (*Chairman*). You have not admitted the fairness of their demand for 4½*d.* per ton?—No, we have not. I should state that that and the question of interest, are the only two points which are now unsettled between us, and I have done all in my power to get them settled. I told Mr. Bass, if he could give me the names of half a dozen gentlemen, I would endeavour to select one to be arbitrator between us to settle these points. If Messrs. Bass consider themselves aggrieved, I should be ready to put the matter into the hands of anyone whom your Grace might appoint to arbitrate between us.

16,901. You have agreed to allow 9*d.* a ton?—Yes.

16,902. That 9*d.* a ton and a lower scale of rates make up the total amount which you have agreed to refund to them?—Yes; but I should state that even if we had obtained the entire list, it would not have put us in possession of sufficient information to deal with it, because this agreement with Messrs. Allsopp is a very extensive affair, and it deals with a great many things which the overcharge sheets could never have made us acquainted with. It is a closely printed document of 13 pages, and there are a great many stipulations and conditions in it which are absolutely necessary for us to know before we could make the allowances to the other brewers.

16,903. Was the allowance to Messrs. Allsopp a uniform per-centage allowance, or did it vary at the different places?—The terms of the agreement are that they should be charged, I think, 2*d.* per mile up to a certain distance; then 1½*d.* and so on, varying according to distance.

16,904. You deny distinctly the statement in the memorial as to these overcharge sheets that the London and North-western Company reduced their charges subsequently by monthly overcharge sheets, sending such sheets to the various stations for the Midland Company to check their correctness?—Yes. The London and North-western Company never sent a single overcharge sheet to us for correction until recently, when the two companies have finally settled, and they are now in our possession, not the overcharge sheets themselves, but the accounts for final settlement between us and the London and North-western Company.

16,905. (*Mr. Glyn.*) I see by the 12th clause of that agreement that the London and North-western Company are obliged to provide storage room at Camden Town, Haydon Square, and Poplar for Messrs. Allsopp?—Yes. The Haydon Square and Poplar accommodation was provided many years before that agreement was in existence. I see that there is a statement as regards the amount of the overcharge. Mr. Cosgrove says that the claim upon the Midland Company amounts to 44,788*l.* That claim consists of 4,662*l.* at the stations purely on the Midland, of 9,073*l.* at the stations off the Midland, and partly

Mr. J. Allport.

3 May 1866.

on the London and North-western, and partly on other companies' lines, and there is a very large item amounting to 11,606*l.*, which is purely North Staffordshire, and arises in this way. The North Staffordshire line joins the Midland a very short distance out of Burton. We did their work, we received their traffic, and dealt with it, and made out the accounts, but the North Staffordshire Company received the money. Messrs. Bass & Company, make a claim upon us, although they know that we had nothing whatever to do with it, it is purely a question for the North Staffordshire Company to deal with, but they swell the amount to 44,000*l.*, by nearly 12,000*l.* which is due entirely from the North Staffordshire Company.

16,906. (*Capt. Galton.*) The North Staffordshire Company carries from Burton entirely without any reference to your line, I think ?—Entirely.

16,907. It has an access to Burton through your station, of course ?—Yes.

16,908. Still I presume it makes rates without regard to you ?—Yes, quite independent of us.

16,909. The traffic which it carries is totally independent and goes through a different district from yours ?—Yes, we are competitors with them to certain places, and the unfairness of the thing is this, that Messrs. Bass & Company have entered into an agreement with us to send the whole of their London and North-western traffic by the Midland route, we having almost as good a route as the North Staffordshire ; but they have not only refused to fulfil their agreement by sending it in that way, but having a claim for a reduced rate, according to our agreement upon the North Staffordshire, they make that claim upon us, and they have deducted it down to this moment, they have kept it back from their accounts. They agreed to send their traffic by us, and they refused to do so, and then they have claimed the drawback from us, as if the traffic had been sent under the terms of the agreement.

16,910. Do Messrs. Allsopp send all their traffic by you ?—No ; they send the bulk of their traffic by the London and North-western, and the North Staffordshire, and by the Midland to places not served by those two companies. In 1861 when that first agreement was made we did not include the North Staffordshire Company, but we undertook to negociate with the North Staffordshire Company to get reduced rates. I hold in my hand a letter from our goods manager to the goods manager of the North Staffordshire Company, in which he say, "I annex you a list of rates " drawn up by Messrs. Bass & Company in accord- " ance with the scale arranged with the London and " North-western Company, which they ask me to " submit to you for your concurrence. I shall be " glad if you will look it through, and say if you " are agreeable to adopt the figures. The figures in " red ink are what Bass & Company wish to adopt " so as to make them divisible. Your early attention " will much oblige." After some negociation the North Staffordshire Company agreed to that, and we then wrote to Messrs. Bass & Company in these terms. "I now beg to hand you a list of the rates " which I have arranged with Mr. Cordon for the " conveyance of ale over the North Staffordshire line. " Please favour me with an acknowledgement and " oblige." We arranged the rates ourselves with the North Staffordshire Company, and now a claim for drawback is made upon us.

16,911. (*Chairman.*) Has the North Staffordshire Company refused to allow the drawback ?—I do not think they have. I should state that from correspondence and interviews which I have had from time to time with the North Staffordshire Company, I have no doubt that with regard to that agreement of Messrs. Allsopp, they were quite as much in the dark about it as we were, there is no doubt about that.

16,912. Do you admit that they have a good claim against you for 59,000*l.*, as mentioned in answer to Question 15,700 ?—Certainly not, we do not admit that by any means. On the contrary, first of all there is this 11,600*l.* which we decline to pay, there is also the question of interest which we decline, and then there is this very large item for terminals which is made in a peculiar way. They ask us to make arrangements for the carriage of their ale to various parts of the country and to Scotland. I hold in my hand an original letter from Messrs. Bass & Company enclosing a list of places, a long list, in which they say that the rates are rather too high, and that they cannot do any business, and that they should be glad if we would negotiate to get them reduced. We negotiated with the other companies, and after considerable correspondence and discussion we induced all the companies to agree to the rates which Messrs. Bass themselves proposed. It is not a mileage rate, but it is a 35*s.* rate to most of the important places in Scotland.. That is communicated to Messrs. Bass & Company, and they have nothing whatever to do with the division of the receipts between the companies, all they have to do with is this, that the rate charged is the one agreed to; but because for the purposes of arrangement between the companies there are certain terminal allowances given for various purposes, (in some cases we carry a short distance only, and in other cases the reverse, and we agree uniformly to a certain deduction at each end of the line to compensate for these inequalities,) and because these allowances have been made between ourselves, Messrs. Bass & Company say you do not do cartage. The clearing house makes an allowance for cartage, and we shall claim that from you. That is the item which Mr. Cosgrove says will amount to about 30,000*l.* in his evidence.

16,913. (*Chairman.*) I do not understand clearly what this 30,000*l.* is, is it in addition to the 59,000*l.*? —No; the 59,000*l.* includes part of the 30,000*l.*, but the 30,000*l.* is the total claim which they say they have to make upon that particular item.

16,914. (*Mr. Glyn.*) In answer to Question 15,756 it is stated "The 77,000*l.* comes under the head of " favouring rates ; we claim in addition 30,000*l.* " under the head of terminals" ?—That is the whole of the brewers in Burton.

16,915. That is not as against the Midland Company only, but as against the others ?—No it is not so ; I will read to the Commission a letter from Bass & Company dated 26th of August 1862 : "We have before " informed you that 35*s.* is the maximum of our de- " livery, and wherever your rate exceeds that figure " the difference is charged by us to consignee. Now, " however, small the amount may be, the trade object " to any such charge, and if we cannot deliver our ales " free of charge they object to purchase. We hand you " a list of Scottish stations which we think should not " exceed 35*s.* The stations to which at present the " rate is 36*s.* 8*d.* have lately been reduced by you " (February 1862) from 40*s.* Now this reduction is " useless, and if you cannot say 35*s.* the rates may " just as well remain unaltered, say 40*s.* for we can- " not deliver free beyond 35*s.*, and if only a mere " trifle per barrel our friends object. Please see " what you can do for us before our season com- " mences." And that letter encloses this long list:—

	s.	*d.*			*s.*	*d.*

Leslie					

I will hand in a letter dated April 1st, 1863, from Messrs. Bass to T. Walklate, Esq., Midland Railway Company, and another dated also April 1st, 1863, from Messrs. Bass to J. H. Bower, Esq., goods manager of the Scottish North-eastern.

The following letters were handed in.

"Burton-on-Trent.

"Dear Sir, April 1st, 1863.

"The list is to hand and for which we feel obliged. We feel sure the Scottish North-eastern Company intended the alteration also to apply to the four stations omitted by you, *i.e.*, Newtyle, Monifieth, Carnoustie, and East Haven, they not being struck off the list furnished by us to the Scottish North-eastern Company, and they erased several that were situated on the Dundee and Perth. The rate to these four stations stands 40*s.*, and yet both Dundee and Arbroath 32*s.* 6*d.*, we ask for the four stations in question to be 35*s.*

"Dear Sir,

"Yours truly,

"Bass, Ratcliff & Gretton,

per J. S. Farmer.

"Ale Rates.

"Burton-on-Trent,

"Dear Sir, April 1, 1863.

"The Midland Company have settled this question to our satisfaction; they say the E. and S. Committee Minute does not apply to Newtyle, Monifieth, Carmoustie, and East Haven, which they say are situated on the Dundee and Arbroath; as you did not strike these four stations from our list, we presumed they were under your superintendence. We beg to thank you for so liberally meeting us, and we feel sure the alteration will increase the traffic.

"Dear Sir,

"Yours truly,

"Bass, Ratcliff, and Gratton,

(Signed) "Per J. S. Farmer."

As I said before, we communicated with the companies, all the Scotch companies and the English companies, and we obtained their assent. We advised Messrs. Bass of it, and they wrote us a letter thanking us for it, pointing out that four towns were omitted, which we then got put into the list, and the whole thing went on satisfactorily until Mr. Cosgrove came here, and complained that we had charged them half-a-crown cartage at each end at these very rates. Then, in another part of his evidence, he complains very bitterly of the inequality of the rates, giving, as instances, the very stations that they themselves include in this list, asking to have them all put upon an equality.

16,916. (*Earl of Belmore.*) You say that these terminals of which they complain, are merely matters of account between you and other railway companies for your own convenience?—Yes; that is so entirely, and they have nothing to do with the brewers themselves. In our account to them we merely charged 35*s.*, or whatever the rate may have been that was agreed upon. It is somewhat interesting to go through these lists of inequalities that Mr. Cosgrove has given. I have been at the trouble of drawing out a list, and I have taken his figures; they are not quite correct, but I assumed them to be so, and I have put in another column what our Parliamentary tolls would be, assuming that we charge the brewers what we have a right to charge under our Act of Parliament. I have taken the places given by Mr. Cosgrove, and the first is "from Burton to Aberdeen;" the charge we make, including terminals, is 32*s.* 6*d.*; the charge we could make, exclusive of terminals, is 115*s.* From Burton to Stonehouse, 35*s.*; and we could charge 111*s.* To Montrose, 106*s.* To Forfar, 106*s.* 6*d.* To Blairgowrie, 97*s.* 9*d.* Then come several routes; from Burton to Ardrossan, 30*s.*, against that we should put 81*s.* 3*d.*; then, to Ayr, 81*s.* To Troon Harbour, 80*s.*; Kilmarnock, 77*s.* 3*d.*; Sanquhar, 69*s.* 3*d.*

Mr. J. Allport.

3 May 1866.

16,917. (*Capt. Galton.*) Do you charge, in any instances, for the conveyance, a sum equal to your mileage rates?—In no instance have we charged that.

16,918. (*Chairman.*) Leaving out of consideration terminals altogether?—Yes.

16,919. Not even for short distances on your own line?—No. I beg pardon, for a short distance I think we have a maximum of 3*s.* 4*d.* a ton.

16,920. Does your agreement with Messrs. Bass and other brewers include traffic only on your own line, or does it leave your own system?—It includes both. "If Messrs. Bass and Company send their ale "to all stations on the Midland railway, the railway "company to charge $1\frac{1}{2}d.$ per ton per mile." Whenever we can make an arrangement with other companies we give them the benefit of the low rate of $1\frac{1}{2}d.$ per ton per mile.

16,921. (*Earl of Belmore.*) Does the minimum of 5*s.* include terminals ?—Yes it does.

16,922. Also cartage ?—Not cartage. I have taken a certain average and I find that the average of the rates charged in that list given in by Mr. Cosgrove would be 1*l.* 5*s.* 3*d.* including terminals, and the rates we could actually charge without terminals is 2*l.* 8*s.* 8*d.*, showing nearly 50 per cent. reduction. There is also a fallacy which runs through Mr. Cosgrove's statement, wherever he quotes rates to other places and when showing how much the London rate is in excess, he gives 14*s.* 2*d.* as the rate to London, knowing at the same time that that is subject to 10*d.* reduction, which makes the whole of his calculations wrong, because the 14*s.* 2*d.* should have been reduced by 10*d.* before he made his calculations. Judging from the evidence it would appear, and the Burton brewers would lead anyone to suppose, that the trade of Burton has been very much interfered with and kept back by the operations of the railway companies. There is probably no trade in the country which has so rapidly advanced as the Burton brewing trade. The wealth of the Burton brewers is proverbial throughout the whole of the midland counties, and the value of the property they are putting up. They think nothing of spending 200,000*l.* or 300,000*l.* in putting up new breweries, and although they have had from time to time large reductions in their rates of carriage in no instance have the public ever received the benefit of it. On the contrary to my certain knowledge the price of ale has been advanced on two or three occasions. If the railway companies were to carry ale free, the Burton brewers would only be too glad, as they would take care to pocket the whole amount. I have here a comparative statement of the increase from 1855 to 1865, and the weight alone from Burton, and this is exclusive of the weight which has been carried by the London and North-western Company since 1862, when they first went to Burton. I find that it has increased from 128,612 tons in 1855 to 344,899 tons in 1865.

16,923. (*Mr. Glyn.*) You perhaps do not know what the tonnage had been in 1845 ?—I did not think it necessary to go so far back as that, but there again Mr. Cosgrove is entirely wrong in his history of the earlier transactions of Burton. I was manager of what was then the Birmingham and Derby part of the Midland railway, and at that early period, in 1842 or 1843, the Birmingham and Derby Company made great attempts to open up this Burton trade with London, but we failed in convincing the then London and Birmingham Company of the policy of giving through rates. I find by invoices that we have still in our possession, that the rate before 1844, that is, in 1843, was 40*s.* a ton, and I find the canal rate, instead of being 13*s.* 4*d.* as stated by Mr. Cosgrove,—and he said that it varied from 25*s.* to 18*s.*, that it got down to 18*s.*,—was 25*s.* a ton for a long time. After the amalgamation of the North Midland and Midland Counties and Birmingham and Derby Companies, the London and Birmingham Company was induced to listen to their suggestion, and a rate was fixed, I think, at about 15*s.* per ton, station to station, but that has been from time to time reduced. The 14*s.* 2*d.* reduced by 10*d.* is not merely from Burton to our station in London, but it includes the whole charge for any quantity they may send down, either by the Regent's Canal to Poplar, or by the North London railway to Poplar and to Haydon Square. Their export trade is very large, and the whole of the charges above stated are paid by the company out of the 13*s.* 4*d.* per ton, and not a word of that is stated in this evidence.

16,924. When you quote that rate it ought to be quoted as the rate not only to London, but also to the West India Docks, and the river ?—Yes.

16,925. (*Capt. Galton.*) Not on board ship ?—Not free on board.

16,926. (*Mr. Glyn.*) According to your experience the great increase at Burton has arisen from the opening of the railways ?—No doubt of it, and they are indebted—I say it fearlessly—for their present enormous business entirely to the policy of the Midland Company. We certainly did pay great attention to it, and of course for our own interest we wish to see the trade increase, and I think in fairness I can appeal to Mr. Glyn to say whether it has not been a constant source of application on the part of the Midland Company for reduced rates for the carriage of the Burton beer from the year 1843. There is no doubt that the Midland Company have succeeded in inducing almost all the companies in the kingdom to reduce their ale rates, to enable the Burton brewers to send those large quantities to the extremity of Scotland, throughout Ireland, and into the South of England, and as far as Cornwall. And now, because we have got those through rates, that is to be used as an argument against us, and it is to be said that we charge higher rates to other places. I think I have now pretty well exhausted this complaint. I hold in my hand another letter, one of many hundreds, in which it is stated that they find they "can do a "trade at Largo, in Fifeshire ; may we note a rate "of 40*s.* a ton from this station to Largo ?" We immediately communicated with the other companies, the rate being then 60*s.* a ton, and we afterwards advised them that we had arranged a rate at 40*s.* a ton. Then again there is another subject ; I mean grain. It was a matter of great complaint with the Burton brewers that there was a difficulty in getting grain at anything like a uniform rate from the eastern counties. There were all sorts of charges, and they wrote to us and stated that if we could charge a uniform rate of 15*s.* 10*d.* a ton from all the eastern counties stations it would be satisfactory. We then commenced a negociation with the Great Eastern Company, and after considerable delay we succeeded in getting them to agree to that rate. I have a letter from Messrs. Bass and Company thanking us for making the arrangement, and saying that it was perfectly satisfactory. In the next season they increased their traffic very largely, and they wrote to me a second letter, in which they say that the reduced rate has worked most satisfactorily, and they hope we are satisfied, as we will see that it has increased their trade. It is then brought against us that we charge a uniform rate without respect to distance, and a complaint is founded upon that.

16,927. (*Chairman.*) Is the correspondence with Mr. Cosgrove, which appears at the end of his evidence, still going on between the Burton brewers and your company ?—No. It is perfectly true that there is nothing in the correspondence alluding to the matter having been discussed, but it has been discussed with Mr. Bass and myself and with other members of the firm. You will observe that here is an agreement for 21 years, and they obtain great advantages. We spent 150,000*l.* in building them a warehouse, and we have spent money at other places for them. We give them greatly reduced rates, and because the London rate happens to be higher they complain, and they wish to cancel this agreement as to the London rate, and to keep it in force as to every other provision. It is a most monstrous proposition, and I am surprised to see the correspondence in this evidence, because I have discussed the matter over and over again with members of the firm. With regard to the rates that the Great Eastern Company give from Yarmouth, it is perfectly true that the rates are low from Yarmouth to London, and wherever the railways come into competition with the sea the rates must necessarily be low. It is that unfortunate competition with the sea, which the Great Eastern Company is subjected to, that I think puts them in their present deplorable condition, and if other railways were in the same condition I fear that neither the Burton brewers nor any other traders would have much reason to congratulate themselves upon the liberality of railway companies, because for the sake of existence they would be obliged to charge much higher rates than they do now. It is the cheap sea competition

Mr. J. Allport.
3 May 1866.

which compels the Great Eastern Company to charge such very low rates.

16,928. (*Lord Stanley.*) You probably think that people have no right to complain of paying the average rates of the country merely on the ground that in some places, on account of special circumstances, exceptionally low rates are charged?—Yes. I may say that I wish they had put in the entire correspondence, for I had a long correspondence with Mr. Bass upon this very subject, and I pointed out to him that if he would by any means return or cause to be returned to the railway company the large capital which had been expended in constructing lines of railway, and would put us on the same footing as the sea, when we should only have rolling stock and working expenses to provide, we should be happy to charge these low rates, but until that is done I think it is manifestly unfair to expect the railway companies to reduce their rates to the sea standard.

16,929. (*Chairman.*) A great part of the evidence refers to the general question of uniform mileage rates, we have received a great deal of evidence upon that subject. Do you think there is anything requiring any further explanation from you?—I think there is nothing else. I do not think any new point has been raised.

16,930. I think the brewers make a distinct demand with respect to terminals, that there should be the same allowance made to them that has been made in any other case of 2*s.* 6*d.* They distinctly demand that the terminals allowed by the clearing house should be recognized when there is no cartage, and that the gross rates should be diminished proportionally?—They have nothing to do with the divisions between the railway companies. That is merely a convenient mode of arriving at what would otherwise cause a great deal of trouble in dividing, in order to meet these inequalities; for instance, I will suppose two lines, each of 50 miles long. If in all cases the division of the mileage was equal, there would be no terminals at all, it would be merely dividing 20*s.* by two, and giving to each 10*s.*, but in some cases, by dividing merely by the mileage, it would give to one 1*s.* and to the other 19*s.*, and that would be manifestly unfair. As the clearing-house system is so huge, it would involve such an enormous multiplicity of duties there to divide in each case upon its particular merits, that for the sake of saving trouble and simplifying the accounts, this system has been, as I may say, jumped at, for it is nothing more than that, simply between the companies, in order that there shall be a certain sum deducted at each end, first of all to meet these inequalities, and then that the remainder shall be divided by the mileage. Take, for example, the case of the North Staffordshire line, and assume that it carries ale to Liverpool; it goes for three-quarters of a mile along our railway, and if we divided it by the mileage we should have probably, some 2*d.* to 2½*d.*,—but it would be utterly impossible that we could carry on our trade at anything like a profit, if we were bound to carry a ton of goods for 2½*d.* The result, therefore, is that these divisions are arbitrary, and made in order to meet the varying circumstances of each particular case.

16,931. (*Mr. Glyn.*) It is, in fact, an arrangement made between the companies, with which the trade has nothing to do?—Yes. Mr. Cosgrove happens to have been a station-master, knowing very little of the general arrangements of the company, and, indeed, nothing more than applied to his own particular station, and knowing that these allowances were made through the clearing house, he thinks that he has a very fine chance for making a claim, and he makes it.

16,932. (*Chairman.*) The clearing-house charge for ale is 4*s.* at Burton, is it not?—That is for everything.

16,933. Relating to that class of goods?—All goods, excepting what are termed special, or the mineral class. You will find that it is 4*s.* a ton carted, and of course all companies know well, and have known for years, that we do not do the cartage of Burton. I would say that there is not a company in the kingdom that is not acquainted with the particular circumstances of Burton, but they do not object, and it would simply resolve itself into another mode of dividing the 35*s.*

16,934. (*Capt. Galton.*) You would have that 35*s.*, whatever charge you were allowed by the companies for carting?—Quite so.

16,935. You would simply add it on to the rate, as you now charge less than your maximum parliamentary rate for this traffic. You would simply raise the rate that you charge to something higher than it is now if you were to allow Messrs. Bass for the terminal?—Yes, and if they should succeed in establishing that claim, the very following day I have no doubt that the London and North-western, the Midland, and the North Staffordshire Companies would give them notice to withdraw every through rate, and give them others to compensate for that unjust claim.

16,936. (*Mr. Glyn.*) You would drop the use of the term "terminal"?—Yes, and we should have to be recouped for the past.

16,937. (*Earl of Belmore.*) The object in fact of fixing this clearing house terminal in a general way is to save the companies from going into a minute calculation on every occasion when they have to make any division of profits between themselves?—Yes, and to give you some notion of the enormous transactions which take place, I believe that the clearing house establishment now consists of nearly 1,000 clerks, and it will be obvious to the Commission what an enormous amount of business that involves. If we did not adopt a system of this kind the work never could be done, and what would be the result? Great inconvenience to the trade of the country, because it would compel all companies to charge their local rates.

16,938. (*Chairman.*) I believe you wish to make some observations upon a portion of Mr. Galt's evidence?—When I was last before the Commission I stated that I should like to make some observations upon Mr. Galt's and Mr. Hill's evidence, but having again gone carefully through Mr. Galt's evidence there is very little that I think it necessary to allude to. He alluded particularly to the cost of conveying passengers, and goods, and coals, and he gives one particular instance with regard to coals, beginning at page 311. He gives an instance of how 1,000 passengers can be carried in a train, and so on. Then he instances the Manchester Exhibition, the Caledonian and Glasgow competition, and so on. All those are so exceptional and so wide of the real facts of the case, that I scarcely think it worth while to trouble the Commission with any remarks upon them. But he does give in two or three places the comparative cost. He gives the average cost per train mile as 2*s.* 7*d.*, then he bases his calculation upon a large number of passengers, and then shows that they can be conveyed for 6*d.* 100 miles.

16,939. (*Capt. Galton.*) I suppose with excursion trains you do convey them at that rate?—We do at a very low rate, but it must be evident to every one who travels that excepting a few exceptional cases, the passenger traffic of the country is very light. I have been at some trouble to ascertain what on the Midland railway is the average earnings per mile by passenger trains. I find the average earnings per train mile on the Midland railway is 3*s.* 11*d.*, and the working expenses may be fairly stated at about 2*s.* 7*d.* per mile.

16,940. (*Earl of Belmore.*) Do you mean that 2*s.* 7*d.* is the average on the whole of your traffic, passenger as well as mineral?—It is a very difficult thing to get that out. We do not keep our accounts in such a way as to distinguish between passengers and goods. I think if you were to take the passengers at about 2*s.* 5*d.* and the goods at 2*s.* 9*d.*, it would be somewhat near the truth. I do not know how that mistake has arisen, but railway companies in making out their working expenses have

omitted several items. Our working expenses show about 45 per cent., but it is simply locomotive power, repairs, and permanent way. It is the traffic expenses without rates and taxes, compensation, and a variety of charges which help to swell up the total cost, and which must be paid before the dividend is paid.

16,941. (*Capt. Galton.*) The returns made by the Board of Trade from the different railway companies always consist of the same elements?—They are made out according to forms furnished by the Board of Trade. I think it must be evident that no reduction in the greater part of the country would induce a sufficient number of travellers to fill the trains. As represented by Mr. Galt, at the time of the Manchester Exhibition 600 passengers was the average of a train. I do not think the trains throughout the whole country would average more than 40 or 50 passengers. If you take the agricultural districts, and take the trains throughout, they will not average more than 40 or 50 passengers per train. It is a very large and heavy train with 200 passengers. The express trains leaving London with 14 or 15 carriages will not average more than from 180 to 200 passengers, and that is taking the very best example that can be selected. His calculations being all based on that fall to the ground.

16,942. (*Chairman.*) Are you of opinion that no reduction of fares would lead to any very moderate increase in the number of passengers?—I think not. All companies with which I am acquainted have from time to time met particular local cases by reduction. Uniformity of fares would be just as absurd as uniformity of rates for goods. I could give instances upon our own line, and upon the North-western. Taking our own line between Sheffield and Rotherham, there is a large working population employed in the trade of the two towns, going constantly backwards and forwards. The fares are 6*d.* for the distance, but if we were to charge the same fare in Lincolnshire, Gloucestershire, Worcestershire, or any of the agricultural districts, it would leave our expenses unpaid. The receipts would not anything like pay the expenses. But that has been done by all companies, the North-western for instance, and the Lancashire and Yorkshire between Manchester and Oldham, and Manchester and Staleybridge; and on the North-western between Manchester and Stockport. They are very low fares, and there is a large population who travel. Mr. Galt recommended that an experiment should be tried, and he gives three instances; he says it should be tried on the Blackwall railway, on the North London railway, and on the London and North-western between Liverpool and Manchester. You have there a population equal to about one-fourth of the population of England, Wales, and Scotland. It is quite clear that an experiment under such circumstances would lead to no practical result, certainly no true result.

16,943. (*Lord Stanley.*) It would not guide you much, I suppose, in ascertaining the results, as compared with similar experiments tried with the agricultural population of Ireland?—It would be perfectly fallacious. Mr. Galt also gives the rate of coals; he says that coal is charged in London at 25*s.* and 30*s.* a ton, and can be bought at the pit's mouth for 6*s.* a ton. He jumps to the conclusion that the difference between 6*s.* per ton at the pit's mouth and 25*s.* at London is the railway charge; and there is also a letter from a firm in London, Harrington and Co., alluding to that; the fact being that the charge from the main coalfields supplying London by railway has not exceeded 6*s.* per ton; the present rate, I think, is 5*s.* 6*d.* per ton. The difference is made up in a variety of ways; first of all, the coal cannot be bought at the pit's mouth for 6*s.* per ton; the coal owner has to find waggons; then there are the city dues; then there is the cartage in London; then there is the coal merchant's profits, bad debts, and a variety of things, all going to make up the difference between the pit's mouth and the carriage. I scarcely think it would be worth while going further into Mr. Galt's evidence.

I wish to make a few remarks on Mr. Frederick Hill's evidence about the Post Office. The effect of Mr. Hill's evidence is to show that if the Government were to take the railways, it would, amongst other things, do away with the difficulty they have in dealing with railways for postal purposes. That is the only point I shall allude to. He alludes to the difficulties of getting arbitrations. Perhaps, in the early history of railways, arbitrations were not so convenient, and not so satisfactory as they might have been; but I think for many years past, with all the larger companies, the Post Office has not had arbitrations to deal with. I do not remember one now for many years certainly with the Midland; and I will say with the North-western, and most of the large companies, it is all done by agreement, and so far from any difficulty being thrown in the way of the Post Office, I believe that we are only too anxious to meet the requirements of the Post Office in every possible way. Speaking on behalf of the Midland, I may state that the payments of the Midland Company are now 44,600*l.* a year, for which we run with trains under notice, that is, the Post Office fixing the times, 537,160 miles per annum; but, in addition to that they have the use of every train upon the Midland railway, goods, minerals, and passengers, to send bags wherever they please. The trains used by the Post Office have a mileage of 1,504,828 miles. We run upwards of 2,000,000 of miles for the sum of 44,600*l.* I have divided that 44,600*l.* between the trains under notice and the ordinary trains. I should say, that the bulk of the trains under notice run during the night. We have very few mail trains running at convenient times for passengers. I find the average of the mail trains will be, including the Post Office payments, about 9*d.* per mile less than the ordinary average of our trains, so that our trains yielding 3*s.* 11*d.*, the mail trains will average about 3*s.* 2*d.*, and that including the postal payment. At 1*s.* 6*d.* per mile that would yield us 40,000*l.*, and taking the ordinary trains at 2*d.* per mile would give us 12,000*l.*, or would be 8,000*l.* more than the Post Office now pay us; but I take 2*s.* per mile, and certainly for a train only yielding 3*s.* 2*d.*, including the Post Office payments, 2*s.* is by no means an extravagant sum to charge for the service, it would then give 66,256*l.* instead of a payment of 44,600*l.*

16,944. (*Lord Stanley.*) Were those terms settled by the Midland by arbitration?—No; we settled them by arrangement; I fixed the terms myself.

16,945. Have you ever had an arbitration with the Post Office?—Not for many years past, not since I rejoined the Midland in 1853, we have had no arbitration whatever with the Post Office.

16,946. (*Capt. Galton.*) The average you receive would appear to be 5*d.* per mile, taking one train with another?—Yes; but it would not be fair to give the same by ordinary passenger and goods trains as well. For instance, we have a train starting from Leeds about two o'clock in the morning, and then one leaves Derby at twenty minutes past five o'clock in the morning; it is perfectly clear that nobody will get up to go by that train, and the train frequently runs without passengers.

16,947. I was not intending to imply that you could have a uniform rate for every train, but I was only wishing to point out that you now only do charge on the average of your own trains 5*d.* per mile?—That is so.

16,948. And therefore you run lower than what Mr. Hill suggested should be the average?—I have taken another mode of testing this to show that the Post Office is really, as far as we are concerned, treated better than the public. I set some of our inspectors to ascertain the number of bags which are sent.

16,949. (*Mr. Glyn.*) Have you got the weight?—We could not ascertain the weight.

16,950. You do not weigh them when starting?—No; we never weigh mail bags. I find we are carrying as nearly as possible 700,000 bags a year; that divided by the money gives about 1*s.* 3*d.* per bag, without reference to distance. If a bag is carried from London to Lancaster, or from Leeds to Bristol, it would come to 1*s.* 3*d.* per bag; so that I do not think the postal

Mr. J. Allport.
3 May 1866.

service is dear. I have every reason to believe this is not a solitary case. I have no doubt that the rates of many of the larger companies are very nearly as low as ourselves.

16,951. (*Chairman.*) Do you think that packages about the same size carried for the public would be charged on the average more than what you receive from the Post Office?—I have no doubt of that, because although some of the bags are small and, perhaps, do not contain more than 200 or 300 letters, others are large sacks, as much as a man can carry on his shoulders. We have had them counted simply as bags. Some of them would contain, perhaps, several thousand letters, and still it only comes to 1*s.* 3*d.* What the railway companies complain of on the part of the Post Office is, gradually trying to absorb the parcel traffic. The complaints of the public about the deliveries of the post are groundless, because if they like they can have as many deliveries a day as there are trains running. Taking the great bulk of the country districts, there is not more than one delivery per day. In many of the large towns there is only one delivery per day, but the Post Office have the power, if they please to exercise it, of sending bags as many times per day as we have trains running between any two places. So that it is entirely their own laches if they do not have as many deliveries as there are trains. I see Mr. Hill alludes to the admirable system of the Post Office as compared with railways, but it does not admit of a moment's comparison. It is a very easy thing to receive letters, directed, where there is no entry required, and nothing to be done with them but simply sorting. But transfer the post establishment up to Camden, for instance, let them deal with one single night's goods traffic from that station, they would find it would involve an amount of sorting and labour which they do not dream of.

16,952. (*Earl of Belmore.*) Do you send any mails without passengers carriages attached to the train at all?—Yes; we have a great number of trains in use. The trains under notice amount to 25 passenger trains and three goods trains per day, and trains not under notice, that is, when the bags are brought to the station, they are given to our guards, and our guards for the time being are Post Office servants. We have 105 passenger trains and 10 goods trains.

16,953. What I meant to ask was this, do you ever send an engine and a van without any passenger carriages attached to it for mails?—No, we do not; we have many mail trains in which very few passengers are carried. The Post Office sorting vans are carried with the van carrying the bags, and we put on passenger carriages in all cases.

16,954. (*Chairman.*) Night travelling is probably diminishing of late years since the express trains have become more frequent?—In summer we find passengers going long distances will prefer travelling at night, for instance, from London to Edinburgh or the north of Scotland, but certainly night travelling is gradually diminishing, and in a few years in my opinion it will almost cease. The morning and evening express trains are now so convenient that there are very few towns that you cannot start from early in the morning and reach London for a day's business, and leave again in the evening. Take Liverpool, Manchester, Leeds, Bradford, or York, you may leave London at 5 o'clock, and reach any of these places early in the evening. Mr. Hill spoke a great deal of the want of communication, but I think I explained that fully before, that no Government management or no Act of Parliament in my judgement would remedy that state of things if the trains are to run conveniently for the public. As regards the leasing of railways, if the Government were to take the whole in their hands and lease them to companies that would not prevent the difficulties at junctions now complained of. Take the three great northern railways, the North-western, the Midland, and the Great Northern, assume they are in the hands of the Government and they are to be leased: take, first of all the North-western; you must have a very powerful combination of capital and talent to form a body to lease the North-western with its five millions of receipts per annum; it would require a machinery quite equal to the present one. So that it would be really transferring the property from the present proprietors to the Government to be re-transferred back to the present management. Then, as regards competition, if *A.* leased the North-western, *B.* the Midland, and *C.* the Great Northern, how is competition to be prevented between those three? *B.* is not to be prevented from carrying a passenger from London to Leeds because both the others have lines. It would involve such a mass of confusion that I think the country would suffer amazingly from such a system, but I trust we are very far from such a system as that being adopted.

16,955. You have stated that the gross earnings of the passenger trains average 3*s.* 11*d.* per mile, do you know what the gross earnings of goods and mineral trains are?—I think our goods and minerals will average 4*s.* 6*d.*, or 4*s.* 7*d.*, or 5*s.*

16,956. (*Earl of Belmore.*) You put the working expenses of your goods trains on the average about 4*d.* per mile higher than those of your passenger trains?—The consumption of coals is greater, and the engines are larger, and the wear and tear is of course a great deal more.

16,957. (*Chairman.*) Then it appears from your answer that in each case the working expenses, whether of a passenger train or of a goods train, are considerably more than 50 per cent., but the total working expenses I think do not exceed 50 per cent.?—Yes they do, but in our accounts, as I said before, we include in our expenses certain things and do not include others. We do not include government duty, rates and taxes, compensation, law expenses, and a variety of other things, but if you come to dissect our accounts, and to deduct from the gross receipts of any half-year the amount we pay in dividends, it will be found as I have stated.

16,958. (*Capt. Galton.*) In the Board of Trade returns all these things are included, the compensation, government duty, rates and taxes?—Then I may have understated our goods and mineral receipts per mile; I have not got it out. Our goods and minerals must average more than what I have stated.

16,959. That would balance it?—Yes, I have had the passengers taken out, and whatever the balance may be would be due to goods and minerals.

16,960. In fact, I suppose you do always carry full train loads of minerals?—Almost always. We carry about 200 tons of coal. Even at $\frac{1}{2}d.$ per ton per mile that would yield 8*s.* 4*d.* per ton, so I must be wrong in the average of the minerals.

16,961. Then it is from your goods traffic that you make the principal part of your profits?—Our receipts in 1864 from passengers were from 600,000*l.* to 700,000*l.*, but from goods and minerals the receipts amounted to 1,600,000*l.* The largest profit to the Midland railway is from goods and minerals.

16,962. (*Capt. Galton.*) Then, in fact, the Midland railway is very nearly approaching that position when it is no longer a passenger railway under the Act?—Yes, it is.

16,963. And would not be compelled to carry third-class passengers at parliamentary fares?—We should never discontinue carrying third-class passengers. In fact, we have discontinued what are termed the fourth class, but all our third-class passengers are carried at 1*d.* per mile.

The witness withdrew.

Adjourned till to-morrow at 12 o'clock.

Friday, 4th May 1866.

PRESENT:

THE RIGHT HON. THE EARL OF BELMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
THE RIGHT HON. ROBERT LOWE, M.P.
SIR ROWLAND HILL, K.C.B., F.R.S.
T. B. HORSFALL, ESQ., M.P.
ROBERT DALGLISH, ESQ., M.P.
GEO. CARR GLYN, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

Mr. G. P. Bidder.

4 May 1866.

Mr. GEORGE PARKER BIDDER, further examined.

16,964. (*Chairman.*) You wish, I believe, to make some additions to your former evidence?—Yes. I would first substitute this (*handing in the same*) as the proper answer, in the place of the one which I gave to Question 16,848:—"Generally, I think, any company "should have the right to forward, by through booking "or otherwise, their traffic over any neighbouring line "or any portion thereof, allowing the neighbouring "company the same rates that they themselves are "charging. If these rates are disapproved by the "company over whose line the traffic is forwarded, "then there should be an appeal to arbitration, and "if the result be to increase the rates that increase "should apply not only to the future but to the past, "in order to check companies from recklessly forcing "their traffic on neighbouring lines at unremunera-"tive rates, at the same time giving them the oppor-"tunity of promptly meeting the requirements of the "district.

16,965. Do you wish to give any further explanations as to the interchange of traffic?—Yes. I wish to explain the operation of that amended answer. I expressed myself last week to this effect, that running powers should be generally granted, but I feel that there would be enormous difficulty and opposition to any enactment of that character, and the suggestion contained in the answer which I have just handed in would, in my view, meet all the main objects, and I believe would be exposed to less opposition of a character which could be well sustained by any sound objections. You have to provide that railway companies should be in a position to be able, on the spur of the moment, as traffic offers itself, to make arrangements for its transport, at the same time it should not be done at rates which would be prejudicial to the company over whose line or lines it would be necessary that such traffic should be forwarded from the company which has undertaken to provide for it; for instance, in Norfolk there is a great demand for corn which comes from the Norfolk markets for the Wakefield markets, and the manufacturing districts. There is also, at certain seasons of the year, an enormous catch of fish at Lowestoft and at Yarmouth, amounting at times to 2,000 or 3,000 tons per week. To the manager of a railway it is a great convenience to be able to say to parties when they come to him, I will undertake to forward your goods to Manchester, to Sheffield, or to the district of the Lancashire and Yorkshire Railway, and I will do it at such and such a rate; he takes upon himself the responsibility of fixing the rate to such places as ought to satisfy the Great Northern Company, over whose line the Lancashire and Yorkshire and the North Eastern companies run. He should also have the power of requiring them to forward that traffic so as to meet the convenience of the trade, handing over to them their proportion of the mileage and the terminals, as the case may be. If his rates are such that they can justly complain of them, they should have a right, as I have suggested, of having them revised by an arbitrator, and if the arbitrator should determine that the rates imposed upon them by the manager of the Great Eastern Railway, for example, were unfair it would be upon his responsibility that the traffic had been so conveyed, and upon that company would fall the compensation to the Great Northern Company over and above the rates he had imposed. That would realize. I think, the two main objects which I think are essential, that is, that the manager of that railway, or any similar situated railway, should have the power, on the spur of the moment, to make a contract for the conveyance of traffic, and should have power to get the goods conveyed promptly and expeditiously without delay; at the same time he should have the responsibility imposed upon him so as not to be able to inflict upon other neighbouring companies over which he seeks to forward that traffic a rate of which they could justly complain. I believe that that would answer all the purposes of general running powers, and be less open to good and valid objections.

16,966. (*Mr. Glyn.*) Do you mean that a company should have a legal power to pass any goods for which it made a through rate over neighbouring railways, but that the amount to be paid to them should be settled by arbitration?—Yes, if they complained of the rate which had been fixed; the company seeking to forward to London traffic, say, for only 10 miles over perhaps a very expensive part of the London and North-western line, would fix their rate, and then if the North-western Company should say that is not a sufficient rate they would have a right to appeal to an arbitrator, and if they sustained their objection, the company forwarding the traffic upon their line, would have to account to them, not only for the traffic then carried but for the traffic which they had conveyed up to that time.

16,967. Would you allow the trains of the first company to run over the line of the other company, or insist upon their forwarding the traffic?—I think the latter would answer the purpose. You might say to them, I require you to forward these goods by a special engine, and that would be an element to be used by the company in resisting that rate, and saying, You will thus increase that expense to us; this is a reason why you should give as an additional allowance over and above what you have determined we shall receive.

16,968. (*Mr. Horsfall.*) You would extend that power of going to arbitration to the traders who complained of any undue charge?—Yes, I think so.

16,969. (*Chairman.*) Do you find now that there is a difficulty in forwarding the traffic such as you have alluded to?—Yes. It is one of the complaints made by the manager of the Great Eastern Company in our contract with the Great Northern Company, that with regard to fish particularly, which of course cannot rise from the sea with punctuality, and must come in as the boats are able to find the harbour, there are delays in forwarding them. They arrive at Peterborough or at any other station after the train has left, and then these perishable articles, fish particularly, are left to come by a later train, and they are, in consequence of the delay, to a certain extent damaged, and sometimes miss the market.

16,970. (*Mr. Glyn.*) I suppose you would require some reasonable notice to be given as to forwarding these trains?—Clearly, so that the company should have time to make the requisite arrangements. The great object is to cultivate traffic on railways, and people are in the habit of coming to the manager and saying, "There is a trade that we can do; we want "a rate; can you give us a rate." If you can you give them one at once; they make their contract, and you get the traffic, otherwise, as in the case of corn,

Mr. G. P. Bidder.

4 May 1866.

the Great Eastern Company have not been able to quote a rate that is satisfactory to the parties, so it is sent round by sea or by some other way.

16,971. (*Chairman.*) Is there at the present time any fish traffic between your ports and Yorkshire ?—Yes.

16,972. What is it that you complain of ?—I have stated that they cannot command the traffic to be forwarded when necessary for the due delivery and preservation of fish.

16,973. You mean that you cannot depend upon its being forwarded ?—Yes.

16,974. In most cases is it not the fact that they do forward it without delay ?—I cannot tell you that ; I know that it has been a serious cause of complaint, but upon that head I must rely upon the evidence of the manager of the railway.

16,975. (*Mr Glyn.*) You propose that a train should be put on specially at the request of the first company ?—Yes, or at least an engine provided.

16,976. (*Mr. Horsfall.*) Is it not the fact that some companies make provision for forwarding fish, meat, and other articles of that description by certain trains, and if those goods are forwarded by other trains they charge double rates ?—I dare say that is so, but I cannot speak to that. The case I have alluded is that of having missed the ordinary train, and then there is a delay, which seriously impairs the value of the article when it reaches its destination in London. Unless fish arrive at 3 or 4 o'clock in the morning, very serious losses occur upon the sale, and the railway companies occasionally have to make considerable compensation for the loss which has arisen from the delay.

16,977 (*Chairman.*) Would you limit those powers which you wish should be conceded to perishable articles ?—No, I would make them general.

16,978. And applicable to all goods ?—Yes. I think that, limited as I have suggested, there would be no injustice inflicted, and the public would have the advantage of being able to contract without any restriction with any company who might be disposed to convey their goods.

16,979. (*Mr. Glyn.*) Would you extend the exercise of the power by the company to any given quantity, or to the whole of a train, or part of a train ?—I would leave it entirely to them. If they required you to forward one truck, you would be entitled to be paid for the engine specially provided for that truck, and for any other service performed. That would be upon reasonable conditions.

16,980. That would be part of the consideration in the question of remuneration ?—Yes, if they did not fix the proper price at first it would be an element for arbitration, as in the case of the Post Office; in settling the amount to be paid there it is settled with reference to the special requirements which the Post Office imposes upon the railway company for the conduct of the mails, and there it is settled by arbitration.

16,981. (*Sir R. Hill.*) Would not this involve very frequent reference to arbitration ?—No, I think not because you see it is a very serious thing for a manager who has imposed traffic upon another company, and he would take care, in the majority of cases, that his rate was fair and reasonable. At present the arbitration is antecedent to the traffic, and then the manager cannot make a contract at once, and is obliged to say I cannot do it until I have settled the matter with Mr. Seymour Clark, or Mr. Allport, or Mr. Cawkwell, and then the opportunity is gone for getting a traffic; whereas in the other case he would be able to say, I will forward your goods, and I will fix such a rate for the carriage of them as Mr. Seymour Clark, or Mr. Allport, or Mr. Cawkwell cannot object to. If they can, the loss will fall upon him. I believe that would supersede all necessity for running powers whatever.

16,982. Do you think it would be possible to construct a tariff of charges that would meet all possible cases ?—I believe it would be utterly impossible.

16,983. You are aware that there is a very essential difference between the arbitrations you have been referring to and those in which the post office is concerned, the post office service being a continual and not a special service on particular days, but a service which continues month after month and year after year ?—I do not think that that would make much difference. If I imposed upon a railway company a special service for a fortnight or for three weeks, there is only this additional element in it—they might say we have got an extra expense imposed upon us by having to make arrangements for traffic that only exists for a fortnight or three weeks, but that is only an additional element that the manager would have to consider before he made a contract.

16,984. (*Chairman.*) Have you any recommendations to make to the Commission with a view to improving the present accommodation for passenger traffic ?—Not for the general passenger traffic.

16,985. You do do not recommend any material alteration in the present rate of charge for positively perishable goods ?—No ; not any general alteration.

16,986. Is your opinion different as to the charges to be made for heavy articles of large consumption ?—Yes. I think, if possible, that arrangements should be made so that coals, iron, stones, bricks, manure, and some articles of agricultural produce should be conveyed at rates which are quite exceptional to anything that at present prevails. With regard to that the idea originally emanated from the late Mr. George Stephenson ; he commenced the survey for a special mineral railway from the Derbyshire coal field to London, and he incurred some considerable cost. I think I am right in saying that he was arrested in that by the late Mr. Robert Stephenson, and I am inclined to think at the instance of Mr. Glyn or Mr. Hudson. I am not sure which, but it was arrested. I heard no more of it until some four or five years ago when Mr. Hawkshaw stated to me that he had been applied to by some gentlemen in the city, who requested him to direct his attention to devising a railroad from the coal fields to London, which should be expressly constructed for that traffic and for that only. His idea was that it might be confined to coals and other heavy articles of commerce ; that the speed should be restricted to 15 miles an hour ; that the line should not approach any town with a view to taking in any passenger traffic ; that such a line should be worked with extreme economy ; that there should be very few establishment charges, very few stations, and those only for the use of the engines. That under these circumstances a rate might be established for such articles that would be extremely low. I said, if such a project is set afloat, there is but one line into London that is adapted for that object, and that would be the district through which the Cambridge line and the Great Eastern runs. It does happen that from Darlington, and of course from all the intermediate district, there is an absolutely flat country the whole way, up to some miles on this side of Cambridge, and there is but one summit at Elsingham that is interposed between the coal fields and Yorkshire and Durham and London, and that is a summit of no very great height. The exceptional gradients that would be against the load are short. So that the load need not be split up but be forwarded over those gradients by an assistant engine. In the year 1863, I think, the survey was completed upon that principle, but it did not proceed further than, I think, the deposit. In the next year the Great Eastern Company took it up on their own account, but they varied the line so as to make it a direct competing line with the Great Northern line, both for passengers and goods and accommodating the intermediate district. That bill was defeated by the Great Northern Company in the House of Commons, for they had some rival lines in the north which were carried, and the line to which I have referred was thrown out. In the next year it was revived by the Great Eastern Company, and by the Lancashire and Yorkshire, and it was then lost on the second reading in the House of Commons. I

believe that the first idea, that of establishing a line specially from the north to London, and appropriated entirely to the conveyance of such articles would be a great relief to the manufacturers of London and the consumers of coal in London. And it would also be a very great advantage to the public generally. A line to be made at a small cost and to be worked at a small cost. It would be also as little aggressive as possible to any of the existing interests. And I have no doubt of the traffic; they might convey coal at a farthing per ton per mile with the same per-centage of profit as is now done with ordinary merchandise, which is conveyed at 50 per cent. upon the cost.

16,987. (*Chairman.*) You would not allow, as I understand you, passengers to travel upon the proposed line?—No; but I have thought that one train a day might come over the line with passenger carriages comfortably well fitted, but not at all with ornament, which would be very well calculated for the conveyance of labourers and artizans, and they would be conveyed at the rate of 15 miles an hour, not more, at a farthing a mile.

16,988. (*Mr. Glyn.*) What capital should you propose in this case?—The capital would not exceed 10,000*l.* a mile.

16,989. How many miles would it be?—If you take it from Cambridge it would be about 120 miles.

16,990. What would the point be in the north?—You would have to pass near Lincoln, which would throw you in connexion with the Midland line which comes from Nottingham, and with the Manchester and Sheffield, and then go on to Doncaster, and to Askern, which would throw you in connexion with the Lancashire and Yorkshire Railway and the North-eastern Railway.

16,991. (*Chairman.*) From Cambridge southwards, you would make use of the present Eastern Counties railway?—Yes, or make an additional line. I should prefer an independent line; but the line of the Great Eastern Company occupies the country through which the best line could be made, and which was intended for it, and the idea was that the traffic should be so timed from the north that it would pass between Cambridge and London in the night season up and down, when there are very few trains indeed and they could be accommodated.

16,992. Unless a new line was made from Cambridge, as far as that section of the country is concerned, it would in no respects differ from the ordinary railways?—No.

16,993. (*Sir R. Hill.*) Does the proposed charge of $\frac{1}{4}d.$ a mile include the use of the waggons?—No.

16,994. What amount would you add for that?—I think the charge on the Great Northern Railway for waggons is 9*d.* per ton.

16,995. For what distance?—To London they charge that. I think it is 9*d.* a ton from the Durham coal field to London, or 1*s.*; but I think it is 9*d.*

16,996. (*Chairman.*) Would there be any terminal charges in addition?—Yes. I think for the station in London there would be a terminal charge of 5*d.*

16,997. (*Sir R. Hill.*) Have you estimated what the total cost would be?—10,000*l.* a mile.

16,998. What do you put down for coal, including the waggons and terminal charges?—That would depend, of course, upon the distance. If you take the Durham coal field, which is the most extreme, I also consider that Darlington would be in the same category as the ports. The Commissioners are no doubt aware that the North-eastern Company have established the principle of charging one rate to every port, and therefore they would start from Darlington in competition with the coal starting from Hartlepool Sunderland, or the Tyne. I believe that Darlington by that route is about 240 miles from London; 240 miles at $\frac{1}{4}d.$ would be 5*s.*; and, adding 9*d.* and 5*d.*, it would come to 6*s.* 2*d.* a ton; and that is about the rate at which the steam colliers convey coal. But then there is this observation to be made, that the coal which comes by railway, if restricted to 15 miles an hour, would be worth 1*s.* 6*d.* a ton more than that which was conveyed by sea, because on the railway it is less broken. It is coming now in large masses. The colliers carry as much as 1,200 tons. And then when at sea the vessel rolls, and there is a little motion given to the coal. How I know this particularly is because I remember a case of a very severe winter five or six years since, when the supply of coal in London was very short; and in fact the gas companies were reduced to within a few hours of the end of their consumption. Mr. Elliott had a very large contract with the Imperial Gas Company, and, in order to meet the exigency of the time, he forwarded a considerable quantity of coal to London by railway; and the result of that was that the manager of the gas works said, "You have sent us a much better coal "than we have ever had before." But that was the effect of conveying the coal by railway instead of by sea.

16,999. (*Earl of Belmore.*) Could a new company make use of the existing stations of the Great Eastern Railway in London?—They could use them if they liked or they could find their own. In the eastern districts of London there are the means of getting stations; but the Great Eastern Company have a very large station in Whitechapel, and when they move their station from Shoreditch into Liverpool Street, they will have a very large coal yard there which they have not got now. Then they have also got the river open to them; they have their lines down to Victoria Docks and down to the River Lea or to Bow Creek. So that they would have the means of disseminating coals throughout a very large district that is now shut out from a supply. I doubt whether it would interfere in the least with the coal that comes by the Great Northern Railway, or very little. Certainly not with the North-western line, nor the Great Western line. Then the cost in London of distributing the coals, if you a have a mile or two additional to deliver it over, would after all meet the difference of charge between what I propose and what the railway companies now enforce. I believe the Great Northern have three-eighths of a penny.

17,000. You do not include the cost of a new station in the estimate you have given?—No, that would be covered by the 5*d.* terminal charge.

17,001. (*Mr. Glyn.*) Do you conceive that this new railway should limit its traffic to the supply of the works upon the lower part of the Thames, and so forth?—You cannot do so; but it would limit itself as to coal, I think.

17,002. You mean from its position in London?—Yes, it would limit itself; it would never do to limit the railway.

17,003. In calculating the quantity you would carry, if you look only to that source of supply, it would be only a limited quantity?—I believe there was a million and a half of tons of coal consumed among the poor population, inhabiting the eastern parts of London, which this railway would supply. Of course it would supply the intermediate district. It would bring coal to Cambridge, no doubt, or to Wisbeach, or to Ely, where it intersects the Great Eastern lines. And at such points they would have an interchange station and avail themselves of this cheap rate by sending coals through the district.

17,004. (*Mr. Horsfall.*) When you speak of the difference of 1*s.* 6*d.* in the value of the coal sent by railway and coal sent by sea, are you stating your own opinion of the value of coal, or what you know to be the difference in the price at which the coal is sold?—I have given you an instance, but the 1*s.* 6*d.* has been the difference in price which has been put upon it by people in the trade. I know however that every time you break bulk in coal it is depreciated in value from 6*d.* to 9*d.*

17,005. But you do not know that there is that difference in the actual sale of it?—No, because I do not know where it could be brought to a test; there is no test for it.

17,006. (*Sir R. Hill.*) You propose, I think, that the coal trains shall run at a speed of 15 miles an hour?—Yes.

Mr. G. P. Bidder.

4 May 1866.

17,007. Is that the most economical rate of speed —Yes.

17,008. More economical than a quicker or a slower train ?—I cannot say of course to a mile, but certainly there is no cheaper speed, and it would also avoid this, there would be no shunting ; It is well known with regard to the trucks which come from the north through Rugby, that half the cost of the repairs of those trucks is caused by the shunting which takes place at Rugby.

17,009. (*Chairman.*) Is not a great deal of it owing to the shunting which takes place to allow passenger trains to pass ?—No, it is at the Rugby station ; there you may see a forest of railway trucks ; they arrive there, and they have to be put into sidings and brought out and sorted again, and then they are taken backwards and forwards, and these trucks are not fitted with springs, and the result is, as I have had it from carriage builders and traffic managers, that as to the trucks coming to London through Rugby, half the wear and tear is incurred there.

17,010. (*Mr. Glyn.*) They are sorted there for delivery at different places ?—Yes.

17,011. What do you conceive is a full train-load in coal trains ?—500 tons.

17,012. (*Chairman.*) Is that beyond what is usually taken in a coal train now ?—I think the Great Northern, by a peculiar adaptation of the engine, or rather the tender, have taken 350 tons, and the North-western Company once, I think, took 300 tons.

17,013. Is that the net weight of the coal ?—Yes ; but there is a delusion about that, because in point of fact there are two engines. They use a tender, and when they come to gradients which demand an extra power, they use the tender as an engine, so that in point of fact there are two engines ; one engine only is used over the part of the road where it is not requisite to use two; but I doubt whether there is any economy in it. I may mention that between Dunkirk and Paris I believe the loads are rather more than I have stated.

17,014. Do you contemplate that that weight should be conveyed by a single engine ?—Yes, certainly ; it is not more than they do in the north, having regard to the gradients over which the traffic is taken.

17,015.) *Mr. Glyn.*) What would be your worst gradient on the line you have referred to ?—The line that we laid down was 1 in 800, I think, but the line that was defeated was 1 in 400. Upon that we should have taken 400 tons net, and upon the exceptional gradients between Cambridge and London we should have had assistant power. I found the other day by accident one of the plans showing the comparative gradients from Doncaster to Peterborough, and then from Peterborough to London by the Great Northern over that route, which I will hand in (*handing in the same*).

17,016. (*Chairman.*) You recommended a special line of railway in this particular instance, owing to the good gradients that could be attained. Do you, or not, think that the adoption of mineral lines in other parts of the country would be advisable ?—I have not considered that point, but I do know this, and I can speak to this with certainty, because I know all the circumstances connected with it.

17,017. I hardly understand why you consider it would be unaggressive in its character in its connexion with other railways ?—Because, looking to the character of the traffic it would accommodate, I do not mean to say that it would be purely unaggressive, but it would be as little aggressive as possible, and certainly would, at the most, only take away from them a small per-centage of the increase which is taking place year by year on their existing traffic.

17,018. (*Mr. Glyn.*) Do you think that the market for coal would be necessarily confined to a particular part of the metropolis ?—Yes, on account of the expense of distributing it in the metropolis.

17,019. (*Chairman.*) I think you said it was intended to carry, besides coal, iron, stone, and some other heavy articles ?—Yes; and bricks.

17,020. Should they be carried by the same railway ?—Yes, bricks would be ; they are very heavy articles ; 1,000 bricks weigh three tons, or more than that, and bricks in London are now at a very high price, whereas they manufacture near Leeds a larger brick and a very excellent brick at I suppose one half the price. Then again there is stone from the Yorkshire district, and it would be a great advantage if that could be brought to London at any such rates. Then again these trains would have their station in London, and instead of going back empty they might be used for the purpose of conveying from London a large amount of the solid manure. It might be sent down at a farthing a ton, and in that way the London manure would be rendered available for at least 100 miles out. When I have bought manure at Mitcham, which has been brought by railway, it has cost me 5*s.* 6*d.* a ton there, and that made it rather dearer than I could get it otherwise for.

17,021. Would there not be considerable delay in returning the waggons for the manure if it was to be distributed along the line ?—Sometimes; but not great delay, because they would make their arrangements so that they would only send the manure when they got a large quantity together, but not that delay which means requiring more trucks for the traffic; and all they got from that would be profit, as the train must go back, and if they had it loaded, all that they would earn from that train would be absolute profit.

17,022. Do you propose that the line should be a double one ?—In the first instanc, I think it should be a single line. If you had 500-ton trains, and you took eight trains a day, that would be about 1,500,000 tons in a year, and that would be a very large quantity ; and if you did it with eight trains, as they must all arrive in London in the night season, it could be all sent, and without interfering with the down trains; they would cross each other only at Cambridge upon the double line, so that neither the up nor the down traffic would conflict.

17,023. Do you propose that bricks and stone should be carried at a farthing a ton per mile ?—Yes.

17,024. Is there not a considerable additional expense in handling bricks ?—Yes, but the parties who bring them incur that; they would put the bricks into the waggons as they do with the coal, which is put into the waggons at the collieries

17,025. Is not that usually done by the railway companies, by their own servants, in the case of stone, for instance ?—Certainly it is ; but that is not the case I have in view ; it is conveyed now, but the quantity is limited. I imagine that if this line was carried out the railway would be taken by branches into the brickfield and into the quarries, as the railways are now taken into coal pits.

17,026. What is the present rate charged for bricks ?—I cannot tell you ; but I doubt, if it is a low rate, whether it is not prohibitory, because it is so heavy, and the difference of price, excepting for short distances, is not great. I do not know whether bricks are conveyed by railway.

17,027. Does not the Great Eastern Company bring bricks into London ?—I do not know. I believe the Great Northern Company conveyed some from a brickfield which is established some 20 or 30 miles out.

17,028. If it was likely to prove profitable why should not they attempt it ?—The Great Northern gradients would not admit of their conveying it.

17,029. I mean the Great Eastern Company ?—You cannot get down there to a brickfield.

17,030. Is there not brick earth on the Great Eastern line ?—Yes; but you must not only have that, you must have a cheap means of burning it and manufacturing it.

17,031. Have you any additional remarks to make as to the effect of such a railway as you have referred to upon the railway system generally ?—I think that

the experience to be derived from that would lead me to say that I am certain the experiment, as far as I can be certain of anything, would be successful, and I think that the experiment itself would have a great effect in showing the enormous advantage to be derived from cultivating general traffic. I think it would be a great inducement to existing railway companies to make arrangements to the same extent of a parallel character. How, I cannot now say, but I believe it would give a very great impulse to railway arrangements generally.

17,032. You have paid a great deal of attention to the cost of working railway traffic?—Yes, we went into that very minutely on the occasion I have referred to.

17,033. Will you be good enough to state generally the conclusions you have arrived at?—The conclusion at which I have arrived as to the cost of working full train loads of 400 tons up a gradient of 1 in 400 was as follows: ways and works, and that means, in fact in that case, permanent way, 3*d.*; but that requires some explanation.

17,034. Are these figures per train mile?—Yes; they are expressly, because the lowest rate at which a line is now maintained and renewed is, I think, upon the Midland and North-eastern, and that is 4*d.*; it ranges from 4*d.* up to 5*d.* and 6*d.* The reason why there is so very heavy a charge at the present time is owing to this, that when the railway was started everything was new; there were new sleepers and new rails, and they only charged the traffic the current expenses of keeping the road in order. There was no fund laid by for some years to meet that which has fallen upon them all now, that is to say, the rails are now, to a great extent, worn out, the sleepers are wearing out, and they will have to be renewed, whereas if a sum had been set aside from the first they would now have been drawing upon that, and that would have abated the amount which they have to incur in the reparation of the road. If 2*d.* a train mile would be sufficient for the ordinary wear and tear, and if they charged 3*d.* and put the penny by to accumulate until the time arrived at which a general renewal was about to take place, they would then have got a sufficient fund together with the continuation of that penny charge to keep the road in repair; certainly such a road as we contemplated where the speed was to be only 15 miles an hour.

17,035. (*Mr. Glyn.*) Over how many years was was that calculation extended?—Fifteen years; but that would vary. I take it for a line where there are about 14 trains a day, which is rather moderate, and the rail there ought to last for 20 years.

17,036. Have you found, by experience, whether it has ever turned out so?—Yes; we have rails that had not been taken up till in the last three or four years, which had been down for more than 20 years, and upon a line with much more traffic than that spoken of. There are cases in which they do not last above two or three years. Then take the case with regard to sleepers, I have known some of them down for 20 years; if I take the life of a very sound sleeper, or a sleeper that had been creosoted, I have known it to be down for 14 or 15 years.

17,037. Do you think that upon the average the sleepers would last anything so long as 14 years?—Yes; good sleepers do.

17,038. You would not say that 20 years was a fair criterion of the life of a rail?—Not if you take England generally; but I say that upon a railway where the trains are not more in number than 14 trains a day I would. If you take the Blackwall Railway—I think there are 350 trains a day there—and that is 13 times as many as I have specified, and that of course would reduce it; but if you take it *pro rata*, comparing the life of a Blackwall rail with some others, we know that they last a good deal longer than that.

17,039. Practically, was there not a great deal of difference in the quality of the rails at the commencement? Were not those that were delivered early of very good quality, while those that were afterwards delivered were very much inferior?—The early rails were much better, and steel rails are now coming in, which are very superior to anything that we ever had, and they should be adopted wherever the traffic is large.

17,040. (*Mr. Horsfall.*) Have you considered how long they will last?—I cannot say with certainty; but the shortest time at which I have put it at has been 40 years; but of course that has reference again to the traffic. A steel rail at a place like the Camden Town station, or other similar stations, if it lasted for 8 or 9 years, would last for a very long time.

17,041. (*Chairman.*) The present cost of maintenance and renewal of way, which appears on the average to be about 5½*d.* a mile, you would say is, in a great measure, owing to neglect in former years?—Yes, in providing a fund.

17,042. If railway companies are now alive to that, and they are setting aside a renewal fund, the cost of maintaining the road ought to diminish gradually?—Yes; but they cannot have a renewal fund now, because the roads have, all of them, got into such a state, that in whichever year it is they have to renew an average proportion. If it lasts for 14 years, one-fourteenth part of the road has to be renewed every year; and it is of no use to have a reserve fund now.

17,043. (*Capt. Galton.*) You do not think that the maintenance of the way will cost more it is now, except with an increase of traffic?—No; and I think it would be a little inclined to decrease. I believe that the rails are now better, and there is more attention paid to the sleepers.

17,044. (*Chairman.*) On the great lines of railway, is not the way in general kept in a very efficient condition?—In a very good condition, as far as I know. If the road is not good, it adds to the wear and tear of everything upon it—the engines, the carriages, the waggons, and everything.

17,045. (*Mr. Glyn.*) As a matter of economy all railway boards would keep their roads in good order?—No doubt, except where their poverty prevented them from doing so.

17,046. (*Chairman.*) When you estimate the maintenance of the way on your mineral line at 3*d.*, do you take for granted that the rails and sleepers will last for about 14 years?—Yes; although the traffic will be heavy, I have no doubt that the rails would last more than 20 years. The wear and tear of a railway increases in a higher ratio than the square of the speed; that is to say, if you double the speed of the engine, you more than quadruple the cost of the wear and tear of the road.

17,047. What is the speed of the ordinary mineral trains now?—They run up to 40 miles an hour.

17,048. Is it not generally considered that the cost of maintaining the way is, in a great measure, due to the heavy mineral trains?—And to the engines; no doubt the mineral waggons occasion more wear and tear than the passenger carriages run at the same speed, but I believe it will be found that the wear and tear of the road is mainly due to the heavy engines running upon it at from 40 to 60 miles an hour. On the Blackwall line, when it was worked by a rope, with 100 trains a day, when the rails, which were of very good quality, were taken up, there was no wear and tear upon them at all.

17,049. (*Mr. Horsfall.*) How long had they been down?—For some seven or eight years, but then there had been no engines upon them, nothing but the carriages.

17,050. (*Chairman.*) The principal element to reduce the cost of maintenance of way on your line would be the reduced speed?—Yes; the next thing is the locomotive, I have put that down under the head of locomotives and rolling stock, which was then intended to include waggons, but all the evidence we could get, all the locomotive managers that I could consult, Mr. Sinclair and Mr. Gooch, and others, insisted upon it that 1*s.* was ample, and I put it down at 1*s.*

Mr. G. P. Bidder.

4 May 1866.

17,051. For locomotive power?—Yes, only; and I think you will find that that is supported.

17,052. It appears to be $3\frac{1}{2}d.$ above the average of the lines generally?—Yes.

17,053. 1*s.* provides for the locomotives and all the expenses that arise out of the engines?—Yes.

17,054. Would 1*s.* suffice for those heavy coal trains?—Yes; although we should have a large consumption of fuel otherwise, undoubtedly, but that would be more than met by the very small amount of wear and tear which would take place in carrying the coal at a farthing a ton per mile; our own coal would be very cheap. These are the main elements; there would be rates and taxes.

17,055. Do you contemplate that the railway company should have nothing to do with waggons?—Yes.

17,056. Would there be any traffic charges?—There would be rates and taxes, but that I take from the Board of Trade returns. I put that at $1\frac{1}{2}d.$, and legal expenses at a $\frac{1}{2}d.$

17,057. (*Mr. Glyn.*) Have you put down anything for keeping up the engine?—The 1*s.* includes that.

17,058. (*Mr. Horsfall.*) When you speak of legal expenses, will you be good enough to explain whether you mean the ordinary legal expenses, or the expenses of obtaining an Act?—I mean the ordinary current legal expenses. Then the traffic expenses or traffic charges are ordinarily, I think, 10*d.* or 11*d.*

17,059. (*Chairman.*) On the average they are $9\frac{1}{2}d.$?—I have put that at 3*d.*, as we should not have that character of charge, which is generally included in that item. We should avoid nearly all miscellaneous charges, that is, establishment charges, secretary, and general contingencies, which I have put down at a penny.

17,060. Would that item be lower on such a line than on a passenger line and mineral line mixed?—I think it would; and these in the aggregate you will find amount to 1*s.* 9*d.*

17,061. Do you think that there would be no chance of injury being done to any person?—We should have nobody to injure.

17,062. Might you not run over people on the line?—The speed would be only 15 miles an hour.

17,063. Do you think that that point might be left out of consideration?—Yes. We contemplate trains of 400 tons, which, at $\frac{1}{4}d.$ a mile, would produce 8*s.* 4*d.*; we assume no back traffic, which would make the train mile earnings 4*s.* 2*d.*, which, I think, is the Midland rate, or about their average earnings.

17,064. (*Sir R. Hill.*) Would the cost of the journey back with the empty carriages be as great as that with full carriages?—No, there would be a little less fuel used. I have taken what I have given as the average.

17,065. (*Chairman.*) All the items that you have enumerated are given upon an average of full trains and return trains?—Yes, full and empty.

17,066. (*Sir R. Hill.*) If you could obtain return traffic, of course the cost in respect of coal would be largely reduced?—Of course it would be all to the credit of it.

17,067. (*Capt. Galton.*) There is no class of traffic, is there, that would fill your trains coming back?—I think we should have some; I think we should have timber from the docks and manure, the solid manure.

17,068. (*Chairman.*) I observe that the lowest amount upon any railway at present for traffic charges is $4\frac{1}{2}d.$, which is $1\frac{1}{2}d.$ above what you allow, and that is on the North-eastern Railway?—They have passenger stations and all the appliances they require, and a staff which we should entirely avoid; but I may tell you where you might get a parallel, and that is in the Blyth and Tyne Railway, for that is a purely mineral line; I am alluding to establishment charges, and they have a gradient of 1 in 70 against the load.

17,069. (*Mr. Glyn.*) You will only have coaling and watering stations?—Yes, that is all.

17,070. (*Chairman.*) Do you know whether railway companies generally adopt the same system in classifying all their various items of expense?—I should doubt it, but I cannot tell you. When we had collected our evidence, our opponents brought gentlemen from the north to show that the average results from the existing lines were hardly comparable. Some of them gave all their train mileage both empty and full, while others returned all their mileage that earned money, and I had great difficulty with them. I detected some of them in my inquiries, and there is no doubt that there is an element of uncertainty in these returns, which, if they are to be made as useful as they ought to be, ought to be prevented by making them more definite, and more uniform, and specifying exactly what they should include.

17,071. Can you suggest any plan upon which you think it would be desirable that all Board of Trade returns should be furnished by the different railway companies?—Yes, I could do it, but not at this moment. I could sit down with Mr. Pole and arrange a plan which would comprehend all the returns that I think it would be desirable to make.

17,072. Do you think there would be any objection on the part of the railway companies to adopt one uniform system, or is there any reason why they should be unwilling to do so?—There is not any great reason, but I think they would rather not make any returns at all.

17,073. But they are compelled, and is there any reason why they should object, to make them all upon one uniform system?—I see no valid reason, but I feel bound to say that I think they would object.

17,074. (*Sir R. Hill.*) Would not such returns, made according to a prescribed form, be highly useful to the railway companies themselves, enabling them to compare the expenses on one line with the expenses on another?—Yes, I think they would.

17,075. Then the railway companies, taking that into account, would, perhaps, not object?—I do not know that.

17,076. (*Mr. Horsfall.*) These returns would also be useful to the public?—Very useful.

17,077. It is a return to which the public is entitled, is it not?—I think so.

17,078. (*Chairman.*) Do you think that the returns now furnished to the Board of Trade are to be relied upon?—I think they are to be relied upon if you knew what they applied to. If you do not get all the particulars you require there would be an uncertainty whether the train mileage includes return trains, and it destroys the value of the returns to a very great extent; they are extremely valuable as they are.

17,079. Do you know the practice as to station work and the shunting at the different stations; is there an allowance of mileage for work of that description?—No; they seem to do it by allowing an assumed mileage, and sometimes by time, and I believe there are some other expedients, but that may produce an element of considerable uncertainty; the proper way, I believe, is to charge the engine's time for it; they cannot make it a mileage.

17,080. If the items of expense are to be divided out per train mile, is it not necessary to convert it into mileage?—No; I have taken it in this way. First, there are the passenger trains, they are a net mileage, and goods trains are a net mileage, including the return trains; then the shunting to nearly the whole extent, if not the whole, is applicable to goods traffic; the shunting of passenger trains is very small. If in the return for the goods trains they superadded what they allowed for the shunting, that would be all you would require, running so many thousands, and shunting so many thousands; that would give you the total cost of the actual running, and the total cost, including shunting, which would be almost an establishment charge; it is arranging goods at a station.

17,081. Could any form of returns be drawn up by which you could calculate pretty accurately and separately the passenger traffic and the goods traffic?—I suppose it might be done, because there is a good deal

of labour upon the railways at the roadside stations, which it would be necessary for them to distinguish, between that which was properly apportioned to passengers and that to goods ; at small roadside stations they probably do both.

17,082. (*Mr. Glyn.*) In other respects there would not be much difficulty ?—No.

17,083. (*Chairman.*) The maintenance of way could scarcely be taken on any other principle ?—No ; but it ought to be there I think ; and if a return had its proper value they should give that which is actually expended upon the roads, that which is actually expended upon the stations, and that which is actually expended in the renewal or reparation of bridges, because, if there are two lines, one with a large number of bridges crossing, I will say the Fens, which are wooden bridges generally, and another line running through a solid country, you cannot compare the maintenance of those two, and suppose them to be strictly due to a road, because the one may include a large item for reparation and maintenance of other works.

17,084. Would there be any advantage in setting out the expenses of the railway companies in greater detail than they are now set out in the returns ?—I think there would.

17,085. You have given us the cost of working your proposed mineral line, is there any prospect of any general reduction in the cost of working other railways ?—No.

17,086. Do you see no item in which any material reduction can be effected ?—Not a material reduction, I think it desirable that greater attention should be paid to the permanent way than is now paid to it, in the manufacture, especially where the traffic is heavy. The steel rail which they are now using is very superior ; they are also using larger and more carefully selected sleepers, and there would be a tendency to economy, although not to any very great extent, but no doubt the steel rail will effect a considerable saving.

17,087. (*Mr. Horsfall.*) Can you state what the comparative cost is ?—I think the steel rails cost 13*l.* a ton.

17,088. (*Lord Stanley.*) I believe that practically they are indestructible ?—Yes, practically they are.

17,089 (*Mr. Glyn.*) But if the price of labour on railways is increasing, that would almost prevent any saving ?—Yes, there is that to be taken into account, because it is rapidly increasing, and where the limit is to be no one can tell, and setting that off against the other, I doubt whether you can look forward to any economy in train mileage.

17,090. (*Chairman.*) Will you be so good as to express your opinion upon the subject of increased safety for travellers ?—I have considered that question, and my opinion is this, that in the aggregate the number of accidents will never be lessened because there are elements of danger that you cannot provide for ; you close the door against one source of danger, and you open another, and the causes are so various ; in almost every accident that occurs there is some new anomaly that was never thought of before, and looking at the great amount of the traffic, and knowing after all that, issue what instructions you like, you are entirely dependant upon those being carried out invariably, and which you have no right to expect practically, I do not think that the number of accidents can be reduced.

17,091. (*Mr. Glyn.*) Would not the use of the telegraph on lines of railway very considerably increase the safety of travellers ?—No doubt.

17,092. Is that in general use on all the large lines ?—Yes.

17,093. (*Chairman.*) I suppose the present amount of traffic could not have been worked without the invention of the electric telegraph ?—Only with very great difficulty. I use the telegraph on the single line from Norwich to Yarmouth, and it was first used on the Blackwall line when we had stationary engines there. Every train had to be started by the telegraph, and when the train was in full motion it occurred occasionally that the rope broke, and then it was very essential that information should be immediately given to the engine-house, and that was generally done before the rope had separated a 100 yards.

17,094. (*Lord Stanley.*) I suppose the chief preventible cause of accidents is the employment of persons as signalmen at stations for too long a time ?—I do not know that, and there is this difficulty about it, you may have in your employ an engine-man who has been on the line for 10 or 20 years, and he has never once misconducted himself ; he has always attended to his duty, and is a strictly sober man ; but all at once he perhaps gets intoxicated, or forgets his instructions, and an accident occurs. That is a thing which no possible means that I know of can provide against. Then again, with regard to a man at the signals ; I have known a man, who was not overworked (and there is, I believe, something in the occupation which affects their minds) ; I recollect a man at Stratford, who was a very steady man, and had conducted himself very well, and he, after having been there for some time, walked on to the line and deliberately laid his head on the rails. He had done his duty up to that time with perfect satisfaction. Then I would say that no engine or railway train ought to keep on the line for 100 yards, not theoretically, and on all the occasions on which I have been thrown off a railway it has always been on the best piece of road, that which was the straightest.

17,095. (*Lord Stanley.*) Then your general conclusion, I suppose, is that it is well it is no worse ?—Yes, and I am sure if it had been said to anyone without any experience, you are going to work these number of miles, and you are going to carry passengers at 40 or 60 miles an hour, and the loss of life and destruction to limb in the course of the year is to be no more than has actually occurred, such a suggestion would have been perfectly scouted.

17,096. (*Chairman.*) Do you know whether the number of accidents in proportion to the amount of travelling is diminishing or remaining about stationary ?—They vary a good deal ; I should doubt whether, if taken by the per-centage, the number has lessened. I may refer to the accident which has just recently occurred at Caterham, and who could have foreseen that ; a boy was running across the line with a lantern, and that was mistaken for a signal. In the gauge experiments in which I was engaged, I was foolish enough to agree to take charge of the narrow-gauge experiments, and we went racing down between London and Didcot. I selected the road between York and Darlington, as being the very best piece of road I could find, and of course we selected engines and carriages of the best description ; we went galloping on until on the very best piece of road between York and Darlington, and off we went ; we were then going at the rate of 50 miles an hour.

17,097. (*Capt. Galton.*) Do you think that the safety of passengers would be increased by any legislative enactment ?—I think that it would very likely be decreased. The truth is that nobody knows the distress and anxiety which an accident occasions to the manager of a railway, quite irrespective of the pecuniary liability of the company ; great annoyance and distress are caused to everyone employed upon a railway when an accident occurs, no one knows how. As far as their experience goes they use every precaution that occurs to them, and I feel certain that you had better leave the responsibility upon them, without giving any instructions, for if they did observe them strictly they would not be responsible for the consequences of accidents.

17,098. You think that further Government interference would diminish the responsibility of the managers ?—Yes ; and I am sure that that ought not to be diminished.

17,099. (*Chairman.*) Can you say whether any considerable number of accidents have been due to an imperfect maintenance of the way ?—I do not know of any. I do not mean to say that there have not been any ; but I do not know of any. Of course when I allude to that lamentable accident at Staple-

Mr. G. P. Bidder.

4 May 1866.

hurst, I do not consider that that was owing to the bad state of the road; that was through taking a rail absolutely out.

17,100. (*Sir R. Hill.*) If the traffic upon the main lines should increase to that extent which would justify having four lines of rail, two for the quick and two for the slow traffic, would not that lead to some diminution in the number of accidents?—No, I do not see that; but I am quite sure of this, that when traffic does increase so that it is necessary to increase the number of rails, you should make two lines of railway through a new district and accommodate that district, and in that case obviate the great element of danger, the having four lines of rails at stations and crossings.

17,101. (*Capt. Galton.*) Four lines will produce as many elements of danger as they were intended to obviate?—Probably so.

17,102. (*Chairman.*) The North-western have a third line of rail running into London, have they not?—Down to certain points.

17,103. How have they found that to work?—I believe it is a great relief to the mineral traffic.

17,104. (*Mr. Glyn.*) To the whole traffic?—Yes.

17,105. (*Mr. Horsfall.*) What is the extent of that third line?—I think it goes down to Bletchley.

17,106. (*Chairman.*) Do you think it desirable that rates generally should be published?—No doubt, as far as they possibly can be.

17,107. What do you mean by their being published? Do you mean that the rates should be published at every station?—That they should be accessible; you can hardly have them at every station. What you might do is this; that you should have at the head station general rates tabulated for reference, and perhaps at local stations they might have extracts from that, which were applicable to a particular station. For instance, the traffic at a road-side station is generally limited to a few articles, and therefore you would not want at that station more rates than would be applicable to the traffic arising at that station.

17,108. Do you contemplate that the publication of those rates should include the publication of terminal charges, all massed in one, or distinguishing the terminal charges?—The terminal charges should be distinguished. I can suggest no other mode than an arbitration.

17,109. (*Mr. Glyn.*) You would not recommend a public board?—No.

17,110. (*Chairman.*) Then one terminal charge as distinguished from a station-to-station rate would be an innovation on the present practice, which is to give the total charge without distinguishing one from the other?—To that station, including the whole rate, it ought to be an advantage to have the terminal charge distinguished from the mileage.

17,111. I think your recommendation is that the station-to-station rate should merely be the actual cost, and that everything should be included under the term terminal charge?—If you could do that,

17,112. Do you think it could be done?—I am afraid it cannot.

17,113. That would be greatly enlarging the ordinary meaning of the words "terminal charge"?—It would; it would alter the meaning of them altogether.

17,114. The words "terminal charge" would be no longer applicable to this particular charge?—The terminal charge would be comprehended in such a rate; but the reason of my suggesting this was that it would be desirable theoretically, if we could do it, that the traffic should be conveyed through the whole of the kingdom on the same principle as the Post Office, at one rate per ton. That is clearly inapplicable to railways; but it should approximate to that as nearly as circumstances would permit.

17,115. (*Sir R. Hill.*) If I understand your previous evidence correctly, you suggested including the whole profit in the terminal charge?—Yes.

17,116. That would make the charge for short distances something enormous, would it not?—Well, it would. You could not carry it out. Of course you must have exceptions to that. You can lay down no rigid rules. I did not intend by any means to lay down a rigid rule. You could not enforce 3*d.* a mile on the short traffic about London.

17,117. (*Chairman.*) Are you of opinion that the scale of terminal charges adopted by the clearing house is pretty near the actual cost of the terminal expenses?—I cannot say that. As between the companies I believe it is a very fair scale indeed; but how far it may be taken as representing the actual cost and the interest of capital involved at stations I have no means of judging.

17,118. You do not know whether, as between the companies and the public, they are reasonable or not?—That I cannot say; but I am quite certain of this, that taking each, and adding it to the rest of the rate, the result is on the whole satisfactory, and I think it ought to be satisfactory. The railway companies are on the whole doing their work at fair rates. Whether it is made up of terminal expenses or the mileage, I do not think matters. The total charge is the thing we have to look to.

17,119. In several instances. the public appear to desire to know what the company charge for terminals, and what they charge for the haulage?—I have no doubt the traders want that, because they think that they may be able to force the railway down in their charges, and it may give them information to enable them to compel the railways to lower their rates upon some particular item.

17,120. (*Mr Glyn.*) They claim also the right of carting for themselves?—Yes.

17,121. (*Chairman.*) I understand that you see no objection to railways being called upon to make public what their terminal charges are at each station?—No; they would give the clearing-house charges for that, undoubtedly.

17,122. (*Mr. Glyn.*) Are you aware that the companies the year before last very nearly came to a settlement to make a general average terminal rate?—It could not be the same everywhere. For instance, at Newcastle and at Manchester it is not the ordinary 1*s.* 6*d.* rate.

17,123. There were certain exceptions made?—I think there are not many.

17,124. (*Chairman.*) Are there not many instances in which it will be impossible for railway companies to make out that the terminal charges allowed at the clearing house are reasonable?—I have no doubt that is so, and I think it must be so. If there is one fixed charge, there must be some cases rather in excess, and other cases rather below; supposing 1*s.* 6*d.* to be the right rate, it is impossible to suppose that the charge for all stations can be the same.

17,125. Do you think there would be any hardship in calling upon railway companies to publish at each station what their terminal charges are for each description of goods;—As I said before, that would simply be the clearing-house rate.

17,126. You think they would adopt that?—I should think so.

17,127. (*Sir R. Hill.*) The average charge of locomotion appears from the Board of Trade returns to be $8\frac{1}{2}d.$ per train mile; is not that so?—So I understand.

17,128. Whether for passenger trains or for mineral trains?—That is the average.

17,129. That is the average of all trains, whether passenger or goods or mineral trains, $8\frac{1}{2}d.$ per train mile?—So I understand.

17,130. Can you say whether the average for passenger trains would be more or less than that if it were separated?—Rather less.

17,131. The cost per mile of locomotion for a long train is, I presume, somewhat greater than the cost of locomotion for a short train?—Oh, no; less. The best work you can get out of an engine, having regard to economy, is when an engine runs about 120 miles a day.

17,132. You must misunderstand me. When I speak of a long train and a short train, I mean a train containing a large number of carriages, and a train containing a small number of carriages?—There is a saving with regard to fuel.

17,133 Can you say what would be the cost of locomotion for an engine alone ?—No. An engine and tender are 35 tons weight, and the resistance due to the engine and tender is about equal to double that, that is 70 tons. If you have a mineral train of 300 tons, it will be as 70 is to 300, *quoad* the fuel; but when you take a passenger engine, going at 40 miles per hour, then the resistance from the atmosphere becomes so large that it destroys that average.

17,134. Then you are not prepared to state the cost ?—What we allowed in the North Staffordshire case—which I am bound to say now is rather too much—was $\frac{1}{2}d.$ per carriage. We charge $11\frac{1}{2}d.$ for the engine, and take off $\frac{1}{2}d.$ for each carriage.

17,135. That for the locomotion only ?—That for the locomotion only.

17,136. Can you say what would be the cost of the wear and tear of the carriage itself in addition to the cost of the locomotive?—I cannot tell you off hand; but I have already handed in a copy of the contract on which the North Staffordshire was worked for 10 years, which gives all those particulars. So far as our information went at that time, except being a little too liberal, I believe, as regards the locomotive and the carriages, that it is tolerably applicable to the present scale.

17,137. The question might perhaps be solved by a careful examination of that contract ?—Yes. That excludes in all cases interest on capital. It is simply engines and carriages being on the road, and the cost of sustaining them.

17,138. Does not the $8\frac{1}{2}d.$ include interest on capital ?—No ; that is the current charges. On the North Staffordshire we allowed $13d.$, but $1\frac{1}{2}d.$ of that was for renewal of the engine.

17,139. (*Chairman.*) You have stated that on your proposed mineral line the locomotive power would be 1*s.* per mile ?—Yes.

17,140. Can you give any details of how you arrive at that result ?—No, I cannot give the details.

17,141. Can you not say how much is due to fuel? —I suppose the fuel would be somewhere about $3d.$

17,142. You are not prepared to give any further details ?—No.

17,143. Fuel is the largest item, is it not?—I think you will find it all stated in the evidence given by Mr. McConnel and Mr. Gooch with reference to the Great Eastern and Northern Junction Railway, 1864.

17,144. You have strongly recommended it to the Commission as in your opinion desirable that railway lines should be worked by limited companies. I think the result of your evidence to-day seems to lead you to the conclusion that no limited company of that description would be able to make any considerable reduction in the cost of working ?—I am not clear that a limited company would not reduce the cost of the establishment charges. I think they would get more work out of the same amount of stock. The plan I wanted to enforce, when I was overruled at the Great Eastern, was this :—With the view of getting the work well done, and to reduce the peculation, the loss from which, I think, amounts to somewhere about 5,000*l.* a year, and also with a view to reduce as far as possible accidents at stations, was to fix the salaries at each station, and then see what would have been the cost of managing that station for any given year, and the quantity of work done ; and then to arrange with the station master that any economy that he could exercise upon that should be distributed throughout the establishment, according to the wages they received, and also that we should apportion to that station a share of the loss from peculation, and that that should be distributed, as I have before mentioned, among the people at the station if they went through the year without any loss. If there was any loss it should be paid out of that fund. If the loss exceeded the fund then a deduction should be made, and there should be a certain allowance to them in the shape of a gratuity per annum if they went through the year without any accident ; but if any accident occurred then that gratuity should be entirely forfeited. By that means I should have enlisted the whole of the staff, as I imagined, to get the work done cheaply, to look after each other, because every porter would be interested in the good conduct of his fellow porter, and they would not only keep a very bright look out on one another, but if there was any misconduct on the part of any one of the servants the others would represent it ; in fact they would look carefully after each other.

17,145. (*Mr Glyn.*) If that were a desirable plan it might of course be adopted by the present companies as well as by a limited company ?—I do not think they will carry it out.

17,146. Why not, if it is a good plan ?—Of course to a considerable extent it would interfere with the patronage, which the directors of some lines value very much.

17,147. Do you think they value that patronage so very much ?—They at all events value it sufficiently to prevent the introduction of such a plan as that.

17,148. (*Capt Galton.*) Did you suggest that to the Great Eastern board ?—Yes, I did ; and although they did not absolutely negative it, they shelved it by appointing a committee which sat for five or six months.

17,149. (*Sir R. Hill.*) When you speak of a limited company you do not use the term "limited" in its ordinary sense : you mean a company limited in the number of its proprietors ?—Yes.

17,150. Not in its liabilities ?—They would limit their liability.

17,151. The liability of the ordinary companies is limited ?—Yes, and so would this be.

17,152. You mean a company consisting of a small number of proprietors ?—Yes.

17,153. (*Capt. Galton.*) You meant probably a company without an Act of Parliament, under the Limited Liability Act ?—Yes.

17,154. In the present state of the law is there anything to prevent the company if it pleases from letting a line to a small number of individuals ?—I do not think they can do it.

17,155. (*Sir R. Hill.*) But it has been done occasionally, has it not ?—The only case that occurs to me at this moment is the South Staffordshire, which was worked by Mr. M'Lean for a time.

17,156. How long was that ?—I do not know how many years he worked it ; but that is no criterion, because that is a small line in the midst of a number of others.

17,157. What is the length of that line ?—It goes from Lichfield down to Walsall, and down to Burton.

17,158. He was the lessee ?—He was ; and then the North-western took it from him.

17,159. (*Chairman.*) If a Permissive Act were passed, allowing railways to let their property to a small number of individuals, do you think any companies would avail themselves of it ?—I think so. I think that offers would then be made to them by individuals, which would be so much to their advantage that they would accept them.

17,160. (*Capt. Galton.*) Have you considered at all the question as to whether any arrangements could be made so as to prevent railway companies which are got up without any capital obtaining Acts of Parliament ?—I think the disposition of Parliament this year is rather to restrict them. We have got one committee in the House of Commons which is called "The Slaying Committee," which has slain every bill that has come before it.

17,161. Were all those bills got up for speculative purposes without having a *bonâ fide* capital ?—Some were got up in that way, and others were got up on the terms I mentioned to the Commission last week, interposing another liability before the existing debentures. Each was, in fact, promoted by existing companies although it was nominally an independent company ; but the capital in the way in which it was provided for, had it been raised, would have interposed another stock before that of the existing preference and debentures ; and the bill was thrown out. Of course one cannot tell the reasons of the committee ; but I dare say that operated on their

Mr. G. P. Bidder.

4 May 1866.

minds in arriving at that decision. It was brought under their notice.

17,162. (*Chairman.*) I think your opinion is not altogether unfavourable to what are called speculative lines?—I do not know how you are to get up a great many without speculation. Such inducements are now continually offered by the number of projects which are originated abroad, some of which hold out good prospects, and are no doubt very sound undertakings, that unless capital is more or less occupied in our own country it will go out of it to a certainty. If they can only be properly regulated and something like *bona fides* given, I think they ought not to be shelved simply for that reason.

17,163. (*Capt. Galton.*) In fact you rather think it would be better not to interfere with the present system of legislation as to new schemes?—I have not considered that subject very attentively, but nothing at present occurs to me by which you could very much improve it.

17,164. (*Chairman.*) What may be termed landowners' railways you think ought actually to be encouraged by compelling the large companies to work them?—Yes, I do. I think certainly where they are got up *bonâ fide* by the landowners that they ought to be.

17,165. (*Mr. Glyn.*) That is, provided the landowners take a certain interest in the line?—Yes.

17,166. (*Capt. Galton.*) As soon as the line is constructed?—When the line is before Parliament, if they mean to support it they should take the stock of that line, because they are quite competent to do that now to the amount of the compensation to be made to them for the land which is taken for the railway. Then, another consideration is this, whether their land is passed through or near, the adjoining landowners are very much benefited, and there ought to be some facilities given in the shape of a rate in aid over a certain district. Where a short line is projected of 10 or 15 miles in length for the purpose of carrying such traffic as an agricultural district affords, and some advantage would be afforded by increasing thereby the traffic of a neighbouring railway, I think that railway should be called upon to work such a line at 50 per cent., although it would cost them more than 50 per cent. to do it, because they get collateral advantages.

17,167. Would not the large companies in general be disposed to encourage any lines that were really *bonâ fide* made by landowners and which received a large amount of pecuniary support from those landowners?—I think they would. Sometimes these lines open out a district to a rival company, and lead them into an adjoining district. In that case of course there would be an opposition from the line which would be so interfered with.

17,168. There might be instances in which it would be difficult to say to which of the large companies the districts of those new lines belonged?—There might be no doubt, but that must be dealt with when the question arises. The probability is that when it arises you would not require to enforce any compulsory powers because one or other of the companies would bid for it. What I feel is this, that as far as the country is not filled up the legislature ought to give facilities for filling it up, and what we should aim at is that it should be done if possible, in a *bonâ fide* way. All these irregular ways of raising capital should be done away with. The capital should be *bonâ fide* raised in some shape or another, at all events upon known terms. If the contractor is to find the capital let that be stated, and let the terms of his contract, as to how much cash and how much in securities of the company he is to take be known; and then if the public like to go into it after knowing that, why they should be prevented I cannot tell, only take care that they are well informed; leave them absolute freedom provided they have the information before them.

17,169. (*Capt. Galton.*) When a line is got up by a contractor in that way you would have that shown by the bill in fact?—It could not be shown by the bill; but the terms on which he is going to carry out the works should be stated, so that the public if they like to go into it after that may do so. He should be compelled to state it in some way or another, in some such form as this:—The capital is 200,000*l.* I have taken a contract for the works for 120,000*l.*, or whatever the amount may be. That 120,000*l.* I have agreed to take, 60,000*l.* in cash, and 60,000*l.* in shares. Then the public will know what are the conditions upon which he has taken the contract, and if after being possessed of that information they like to furnish the rest of the money, why they should not be allowed to do so I cannot tell.

17,170. (*Chairman.*) Then you do not think any requirements of that kind would be evaded?—Of course everything can be evaded; but I think that if you made it, as I suggested the last time I was before the Commission, a misdemeanor, very few would risk that.

17,171. (*Sir R. Hill.*) With reference to one of the branch lines of which you have been speaking, suppose the landowners and others in the neighbourhood to desire to make the line in the most economical manner, to avoid all unnecessary expense, and to give the land at something like its value as agricultural land, can you say at what rate per mile such lines might be made under circumstances of ordinary difficulty as to cuttings, embankments, and so forth?—I cannot give a general answer to that. The permanent way may be taken at 2,500*l.* per mile.

17,172. A single line or a double line?—A single. That may be more or less, according to the facilities at which you can get the sleepers and other materials conveyed to the spot. The land may be taken at 10 acres a mile. I suppose the agricultural value on the average would be 50*l.* per acre, that is 500*l.*; but of course beyond that you have to erect a station and such works as may be necessary; and what the average of those works would be nobody can say. You will find in nearly all the deposited estimates 5,000*l.* is put down for a double line.

17,173. Would the 2,500*l.* per mile include rails?—Rails, sleepers, ballast, and laying.

17,174. Bridges?—Not bridges.

17,175. But supppose the line ran along the surface?—If it ran along the surface, and there were no bridges, it could be done for 2,500*l.* per mile.

17,176. (*Capt. Galton.*) With some small amount of cutting?—Whatever cutting there was would have to be added to it.

17,177. (*Chairman.*) Is it your experience that land can be procured on the average, even agricultural land, at 50*l.* per acre. Certainly not. On the average it may be taken that we pay four times the agricultural value. I think the cheapest line I know of, considering where it was made, although very much to my cost, was between Wimbledon and Croydon, for 45,000*l.*

17,178. (*Capt. Galton.*) The land was given them for a considerable distance, was it not?—No; it was five miles in length, and the capital was 45,000*l.*, and in order to get it made the estimate for the land was 10,000*l.* They had some difficulty about it, and I said, "Well I will take it upon myself," and it has cost me 8,000*l.* more. There was this curious case happened in connexion with it. Part of the line, for some 300 or 400 yards, went on the site of the old Merton tramway that fell into the hands of the adjoining landowner. The landowner into whose hands it fell (when they got the Act of Parliament, in case of dispute he had a right to try it), when they offered him 10*l.* for that piece of land objected, and I think they settled it at 30*l.*, which I believe he never paid. When it was taken by this railway his own estimate for that piece of land was 4,839*l.* He got very celebrated surveyors in London, who valued it at 2,400*l.*, and eventually he was paid 700*l.*; but I have no hesitation in saying that 100*l.* was the very outside value.

The witness withdrew.

Adjourned to Thursday next, at 12 o'clock.

Thursday, 10th May 1866.

PRESENT :

The Right Hon. the Earl of Belmore.	Geo. Carr Glyn, Esq., M.P.
The Right Hon. Lord Stanley, M.P., F.R.S.	A. S. Ayrton, Esq., M.P.
The Hon. E. F. Leveson Gower, M.P.	Capt. Douglas Galton, R.E., C.B. F.R.S.
Sir Rowland Hill, K.C.B., F.R.S.	E. T. Hamilton, Esq., M.P.
T. B. Horsfall, Esq., M.P.	William Pole, F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

Mr. Edwin Chadwick, C.B., examined.

Mr. E. Chadwick, C.B.

10 May 1866.

17,179. (*Chairman.*) I believe your attention has been a good deal directed to the railway system of this country ?—Yes ; and I beg permission to mention the way in which I have been led to do so, because, as a general rule, I deem it objectionable to express, only on incidental or casual attention, confident opinions on great questions or on large principles. I have given much study to the principles of public administration, and in connexion with the new poor law, and as a Commissioner of inquiry, and in that and other commissions as an executive officer, I have had the honour to be associated with engineers of some eminence, who were serving in civil capacities. As a Commissioner of inquiry into a general system of police, much of the action of which must be on the public highway, I came across the subject. On the early question, as to the state of the national defences, the subject of the new means of communication was much discussed amongst us. I was led to entertain strong objections on administrative principles and public economy, to giving up the main lines of communication, to be traced out by trading companies, and worked by them as a monopoly and for a trading profit. I was led, being applied to by continental administrators for opinions, to give them warning against following the course adopted in this country. The conclusions at which we then arrived were much the same as those embodied in the report of Captain Drummond and Sir John Burgoyne, and other commisioners who reported on a system of railways for Ireland. I conceived about that time, in connexion with poor law administration, that the demand for labour created by the construction of new railways might afford some relief to the agricultural labour market, and I was led to pay attention to that point, and to make inquiries as to the operation of the new railway works. I found, however, that from the barbarous haphazard methods in which labourers were employed, and the way in which the works were constructed, those works really did as much mischief as good to the labour market of the country. I thought the evils were very pressing at that time ; but our Commission could not take any direct notice of it, and I therefore wrote and published, at my own expense, a paper "on the demoralization and mis- "chief occasioned by the want of proper regula- "tions for the labourers engaged in the construction "and working of railways." I further published and circulated amongst the directors, in order to induce a voluntary correction of those evils, a paper founded upon some evidence that I got together for a committee of the House of Commons on the subject of railway labourers and labourers upon public works. I aided some inquiries from the Board of Trade on the companies' accommodation for the poorer classes of travellers. At the time of the Exhibition there were difficulties in collecting some articles together, and at the Society of Arts a committee was formed to examine the subject of the postal conveyance of parcels, and they requested that I would draw up a report or take evidence upon the subject, which I did ; and it showed, I think, that great mischief was occasioned to trade and to the arts by the want of facilities for the conveyance of parcels. I drew up a report, which was adopted upon the occasion, setting forth that the hindrance was owing to the position in which the railways were placed by the principles upon which they were conducted. Later on the National Association for the promotion of Social Science did me the honour to make me president of the section of Economy and Trade at the Social Science meetings, and I then considered the state of the manufacturing districts as governed by the arrangements for the transit of goods and passengers. I went down to Manchester and made inquiries upon the subject, but I found that the information I received was too large for development in my presidential address at York, and I made much of it the subject of an address delivered in London. After that I was asked to repeat and to bring forward the same subject in the Society of Arts. It is upon such investigations and discussions that I have ventured to express confident independent opinions for the future, based upon subsequent verifications of the original warnings as to the past verifications by competent and impartial witnesses, civil engineers at home, and public administrators abroad ; and with respect to the railways in Ireland, valuable confirmatory testimony as to the errors of the past, as a warning for the future, was given in a paper, and in the discussion on the paper by Mr. Hemans, the engineer, read at the Institute of Engineers, when it was admitted that the recommendations of the Irish Railway Commissioners had proved to be sound in the main, and that it was to be regretted that they had not been carried out.

17,180. Can you give the Commission the date of that discussion ?—It was in November 1858. On that occasion the concurrent opinions were expressed of Mr. Hawkshaw, and of engineers and others connected with Ireland, as competent and independent opinions as any that might readily be collected, that were entirely confirmatory of our early warnings. From Mr. Mohl, of Wurtemberg, an able administrator of wide German reputation, I have received a letter, in which he rejoices that the public control over the railways has not been yielded, and declares that he shall do everything in his power to prevent the example set in England from being followed, or the control of the public highways being given to private speculators. Besides getting a cheaper and a readier system of communication for his State, he rejoices that he has taken the system of communication in the country out, as he puts it, of the hands of the wolves of the Bourse, and prevented the demoralization and jobbing that is attendant upon commercial speculations in these matters.

17,181. You are of opinion that the railway legislation of this country is rather an obstacle to public progress ?—My belief is that the benefits derivable, for the future, from the cheaper and better use of the existing railways, from the completion of branches and new main lines, will be found to be collectively as great as any that have resulted from the existing system, and that these possible benefits for the future are in great measure prevented by the past and existing false principles of legislation. In agricultural economy, in extending high cultivation in England, tramways or horse railways are laid down to economise the removal of crops or the transit of manures within the farms. Common means by horse tramways are needed, for the economical transit of produce from farms, or manures to farms. My observation, chiefly in England, of the extensive need of such horse railways, as well as ordinary branch railways, is corroborated by the observation in Scotland of Mr.

Mr. E. Chadwick, C.B.

10 May 1866.

William Chambers, of Glenormiston, the chairman of a railway company, who, in a recent work, in illustration of the practicability of the cheap extension of railways, adduces as a conclusive fact that a line of railway in Scotland, the Peebles Railway, has been executed, with station-houses included, at the cost of 5,000*l.* per mile, a single rail, which is now paying to the ordinary shareholders a dividend at the rate of 6 per cent. per annum. As corroborative of the view of the need of cheap branch railways derived from his observations in Scotland, and which I apply to England, he cites an estimate made by Mr. Jones, a civil engineer of Wales, I believe a member of the Institute of Civil Engineers, a respectable man, who estimates that there are 8,000 miles of valley in England without railway communication, containing five millions of acres, more or less, of which are available for agricultural purposes, and he shows that if this land were increased only 1*s.* per acre in rental, by the formation of railways, the landlords would gain 250,000*l.* a year. In my view the great need of the free extension of railways in the agricultural districts would be more commonly for horse railways rather than for railways to be worked by locomotives. Beyond these, for the completion of our railway system in the rural districts, there is extensive need for horse railways or tramways for towns, or for the suburban districts of the larger towns. The sort of horse railways needed for towns may be seen near Paris, or between Sevres and Versailles. The French Government directed experiments and trials to be made with the tramways, and the result was that a horse can, on a level tramway, draw $3\frac{1}{2}$ times the weight at the same speed, and with the same expenditure of power, that he can on an ordinary road, and that up a gradient of 1 in 100 he is capable of drawing 2·25 the weight he can do up the same gradient on a common road. As a general rule, that one horse will do as much as three horses; or that two horses instead of drawing 20 people in an omnibus will draw 60. On large farms or works over large areas in North America, cars are in use for carrying workmen and saving "walking time" in walking from one part of the farm or works to another. In our manufacturing districts wages are tending to American prices, and the wages of artizans may be reckoned at 6*d.* or 7*d.* per hour, and walking time for six or seven miles costs 1*s.* By omnibus power the transit is effected for 4*d.* or 3*d.*, but by horse railways it may be be done for 2*d.* or less. In the State of New York 256 miles of horse railways are provided for, of which 166 miles are completed, of which 66 miles are street railways. In the city of Philadelphia there are 69 miles of street railways, *i.e.*, for wide thoroughfares. In London each horse draws six passengers; in Philadelphia on the street railways each horse draws more than 16 passengers, with fewer accidents, and these street railways are being greatly improved, and connected with the general system of transit. An effort was made by the London General Omnibus Company, at the instance of some French administrator, to get a system of tramways introduced in the wider suburban lines; but the attempt was defeated by parochial opposition to them. Upon the whole, looking at French experience, and looking at American experience, I think that for easing the centre of towns, and distributing the population from overcrowded districts into the suburbs, a system of horse railways as well as of branch-locomotives would be extensively needed. With respect to agricultural tramways and small branch tramways, they cannot be laid down, or at all events they are prevented from being formed, by the enormous expense of the present system. Also by the fact, that if you want a branch railway it will have perhaps to go across the country, and it may pass between two established lines, and by one of them it may be viewed as a feeder to the traffic of the other. Hence the opposition; but at all events the expense of the present parliamentary procedure is so enormous for these branch railways as to present in itself almost a prohibition. Certainly in a large proportion of cases the expense of obtaining an Act of Parliament would amount and it does amount to a prohibition and the most important extensions are therefore not carried out.

17,182. Do you mean the ordinary parliamentary expenses for a bill to which there is no opposition?—I mean the ordinary parliamentary expenses.

17,183. Even when there is no opposition?—In truth the difficulty and expense of that procedure in respect to improvements in towns, with which the sanctions for branch railway communication would be analogous, was so enormous as to be prohibitory. The average expense of Local Acts may be set down as 2,000*l.*, and when unopposed, not less than 1,000*l.*

17,184. Is there not an Act now in operation to this effect, that when there is no opposition, the Board of Trade may grant powers for the construction of the railway?—In some cases the majority will not oppose the scheme; but perfect unanimity among owners is not common, and it is common that there is an attorney who will stimulate and undertake opposition for the costs. The relief of London from overcrowding by the spreading of the population, by horse railways, was found impracticable from the expenses of the oppositions entailed by the present parliamentary procedure. Whether for small or for large works, I submit that that procedure, which is the opprobrium of our legislature, ought to be entirely superseded. And it might be superseded by the tried, and proved more efficient, economical, and satisfactory procedure adopted under the Public Health Act, as directed by the first Board of Public Health. Under that Act, instead of calling before us witnesses or parties to London, when application was made from any locality for the sanction of new works, of water supply or drainage, or new roads, we sent a competent engineering inspector to the locality or to the witnesses. We directed him to first make his own survey of the district, and to form his own opinions as to facts on which he might advise, and having done that he was to call the people of the locality together, in the town or district, hear their objections, have them discussed, and answer all questions they might put to him for their information; as to the expense that would be, in his view, incurred, and the benefits to be derived in return for them. After that examination and upon public discussion, he made a full expository report to us. That report was printed and circulated within the districts for local consideration. After a time for hearing any objections an order of the nature of a local Act upon further local consultation was circulated in the locality, and upon that report an order was framed, founded upon that local consultation. The expense of all that process was first to last, after paying the engineer for going down, and paying for the report which was locally circulated, giving them information such as is never obtained upon a parliamentary procedure by bringing the witnesses to London, many of whom are not heard,—the expense of all that was about, I think, speaking offhand, 100*l.*, including the printing and circulation of the report, the order, and everything. Now that mode of procedure would be applicable, I think, to the extension of railway communications for the future, and it would, in every respect, be better. It would get rid of the enormous and scandalous expenses to which the local public are subjected by the present parliamentary procedure, and the business would be done in a manner to give general satisfaction.

17,185. (*Mr. Ayrton.*) Have you seen and read the Acts which have been passed for England, Scotland, and Ireland, for the formation of tramways or railways without application to Parliament?—I am only acquainted with the effort that was made by the London General Omnibus Company to get tramways for the relief of the metropolitan traffic to the metropolis, which failed from the amount of opposition that was brought against it. An American

speculator also introduced some tramways, and I thought them good, but they also failed from the opposition that he met with, and there have been, I believe, other private projects, which have been attempted elsewhere, and have failed.

17,186. Have you read the Acts which have been passed on the subject?—No; I only know of the general extensive needs, which the existing legislation, whatsoever it be, fails to accommodate.

17,187. Did you ever read a bill that was introduced into the House of Commons for the general construction of tramways in England with the sanction of the local authorities, and which was referred to a committee of the House?—I have not; I was not at all aware of it, but I am certain of this, that local examination, such as was tried in the instance to which I have referred, would, if similarly directed, be efficient, economical, and satisfactory to the localities. The present inquiries before parliamentary committees, enormously expensive as they are, are yet dangerously and scandalously defective. You do not get anything like the evidence before committees, or could get before boards, that you get on the spot. People the most deeply interested often know nothing of what is being done in London, notwithstanding troops of picked witnesses carried there and kept there at enormous expense. My own experience in the procedure to which I refer, as applicable to railway extensions, and the general parliamentary procedure in respect to railways, is that the objects might be obtained satisfactorily at one-twentieth the expense that is now incurred for obtaining them imperfectly and most unsatisfactorily.

17,188. (*Mr. Horsfall.*) Will you be good enough to state what class of person you think should be sent down to make the inquiry, and obtain the necessary information?—Professional persons with special aptitudes of the engineer class. For the new works of sanitary improvement, we sent down civil engineers,—with such special aptitudes as we could find; as sanitary works did not then, as it should do now, form part of the training of the Royal Engineers. In respect to the subject matters in question, as the projects would generally be those of civil engineers, I believe they would themsleves prefer to have reports of Royal Engineers rather than of civil engineers,—rivals in practice. I should, for the matters in question, prefer, *cæteris paribus*, a Royal Engineer of special aptitudes and preparations to form an independent opinion himself and take evidence on the works proposed.

17,189. Would you propose that he should hear and decide upon all objections that were brought before him?—No; he should hear, but upon that I think the procedure might be in precise analogy to the procedure under the Public Health Act. He should report to competent permanent commissioners or a board. The inspector in our case heard all objections, and submitted a report on them. If there was any appeal, it was first made to the central Board in London, and in some cases where the judgment of the first inspector was disputed we sent down another, so as to let the parties be heard upon the spot, and in cases where that was done it was very rare that any objections were available, or that the objections were not removed. But beyond that there was still an appeal to Parliament. If both the inspector's report and the Board's order were held to be broadly objectionable, a select committee of the House could be appointed to hear the objections. The default in that mode of procedure was that the Board was not heard, nor its officers; they only heard the witnesses which commonly some attorney, having a bill to make out, brought forward.

17,190. Then would you have the Board of Trade made a court of appeal in London?—In my view the Board of Trade, under a changing political chief, who has now more to do than he can attend to, or any board with other and disparate subject matters to attend to and functions to execute, is a most imperfect and unsuitable executive for the purpose. The difficulties to be overcome can, in my view, be only overcome by severe and undivided attention. I conceive that the interior communication of the country is of such importance as to justify and require a completely independent functionary for the purpose, and as a question of administrative organization. It is not only my own opinion, but I am supported by the opinion of a man whom those who know most of his writings will most respect, I mean Mr. Bentham, who, in an outline of a constitutional code, made the minister to conduct the interior communications of a country one of the Prime Ministers of the State, it being more the duty of the State to look to the interior communications throughout the country than of private individuals.

17,191. (*Mr. Ayrton.*) You would adopt the French mode, and have a Ministre de Ponts et Chaussées?—I am not sufficiently acquainted with the details of the organization and action of the department of the Ponts et Chaussées to speak myself as to the applicability of it in detail to our needs. I only know, in respect to the French administration, that the late Sir John Easthope, who was an early promoter of the first railways, served also in some of the French companies, and he was loud in his praise of the superiority of French administration, in which he was supported conclusively by the late Mr. Locke, President of the Institute of Civil Engineers, and others.

17,192. And who was largely engaged in railway speculations in France?—Yes, he was an engineer of great practice in both countries.

17,193. Under the French system a new project is first submitted to the minister, and unless his fiat is obtained, no progress can be made. You are aware of that, I presume?—Yes.

17,194. Are you aware also that under that system it was found impossible to make a railway from Calais direct to Paris for many years, because there were so many private interests involved which obstructed it?—I am not aware of that fact, or that there may not be defects in the French system, though not, I judge, from impartial practical testimony, in any degree so bad as our own.

17,195. Are you aware that unless the fiat of the minister is obtained by private influence it is quite impossible in France to advance a railway project, or unless private interests are conciliated?—Large defects have been alleged against them, and it has been rumoured that political ministers are swollen with large fortunes from concessions and extensions of concessions beyond their official emoluments, the truth of which allegations or reports it is perhaps not necessary to touch upon here.

17,196. Are you aware that it is the general impression of the state of things in France, that no public enterprise connected with communications of any sort can be proceeded with unless the Bureau de Ponts et Chaussées is conciliated?—No, I am not at all aware of that; in fact, with respect to the frequent rejection of projects that are of public benefit locally or generally, I do not believe it. It has been alleged publicly that parliamentary candidates for a seat in the legislature have held forth that if they were elected they would promote a particular railway projects, but I believe that even such allegations are exceptional.

17,197. Are you aware that you cannot even make surveys and obtain information to ascertain whether a project is sound, without first obtaining a licence from the Government Department?—I have not gone into all the details of this branch of administration in France, but I am aware, from the testimony of those who are practically conversant with it and with the administration in this country, that the French administration is superior; amongst other things in this, that there is a general survey or cadastre applicable for the direction and formation of all works of internal communication, and, if the like foresight and care had been used in this country, if we had proceeded with a general survey, or an ordnance survey, such as was proposed early by

Mr. E. Chadwick, C.B.

10 May 1866.

engineers, I am told that on surveys alone 20,000,000*l.* would have been saved to the country.

17,198. You have adverted to applications made to Parliament for improvements of towns. Do you not think that there is a difference between an application by a public body for public objects, for example, by the inhabitants of a town or their representatives, for the improvement of their town; and an application made by private individuals for their private profit, as in the case of an application made for the construction of a railway?—I see no essential difference in the procedure needed for the sanction of the different sorts of local works. But I wholly repudiate, as a most mischievous economical and legislative fallacy, that roads should be given up as monopolies for private profit, or to make the profit by a rate or toll a test at all.

17,199. If individuals are to construct it, or an aggregate of individuals are to construct it, for their private profit, that must be an element in the matter, or you would entirely preclude the construction of railways with a view to profit?—I think that the profit is a false test of the value of a road to the public. It is common that a road which is a total loss as a private enterprize for a profit, is yet profitable to the general or the local public. As a general rule, a toll, or a rate beyond the mere cost of service, merely proves that so many people can use the road, but it does not prove how many people are hindered from using it by the toll. I would present to the notice of the Commissioners, as one example, Waterloo bridge. That is utterly ruinous to all the shareholders concerned; it does not pay; or if it pays its expenses it is as much as it does. Now, to my knowledge, the formation of that bridge advanced the rental to the extent of 30,000*l.* or 40,000*l.* a year on the south side of the bridge alone, and if it, the south side, within walking distance, had belonged to one landlord, it would have paid him to have constructed the bridge and to have opened it free; the bridge would have been a good investment for the improvement of his property. And with respect to the hindrance created by tolls. I may mention that there were 2,500,000 people who went over that bridge when the toll was 1*d.*, and when they lowered the toll to a halfpenny I think there were more than 5,000,000 who went over it, or a larger income derived from the smaller coin. In the case of that bridge, I believe it would now pay the landowners of that district, if you could only get a rate, if only within the walking distance from one it, to buy up the bridge entirely, and open it free. In the case of Southwark bridge, where there was 1*d.* toll, when the toll was removed the traffic was augmented tenfold. The bridge accommodated a given number, but the toll hindered ten times more, and I think that the same principle is applicable, *mutatis mutandis*, to railway communications.

17,200. Your view appears to be, that railways should not be constructed for private profit by a company, but merely as a means of communication from one part of the country to another?—Yes, just as a highway is made. The main lines of communication are the rightful service to the public, and free and safe communication a duty of the State, and all the means to that end ought to be maintained for the people. My idea is that branch railways might be put on the same footing as turnpike road trusts, out of the rates.

I have made some inquiries about the increased value of land caused by the construction of railways. The late Mr. James Morrison, who gave attention to this subject, requested me to obtain for him some information as to the increase in the value of land occasioned by railway communications. I was too busy at the time to attend to the subject myself, but I recommended him to get the assistance of the late Mr. Smith, of Deanstown, who inquired into the subject in Scotland, and ascertained, I think, that the increase in the value of land, as a general rule, by the introduction of a railway in a district, the name of which I do not recollect, was about 2*s.* 6*d.* an acre per annum, for five miles on both sides of the road, which sum, if it had been capitalized, would have enabled the road to be formed, and then it might have been given over to trustees to work.

17,201. In your view, a railway should be made by some central authority, or by local commissioners, on the principle that the charge for using it should be sufficient to pay for the cost of construction?—I have conceived that the roads might be made and worked by contractors for the district, or for the general service of the public, as has been done most beneficially in several of the continental states. My original notion was, the Government then having no staff of engineers available for such works, that it was for the Government to lay out the main lines of communication; and then I proposed, what was done on the continent, that the work should be let out to be carried out by contractors, or the best bidder; and in general, if possible, as to all works, and particularly railway works, that they should not only be constructed, but be worked on contract, as it has been done in many places. I have not been able, nor has it been in my way to see how they have been done; that might be an important service to have responsibly done by an assistant commissioner, but the comparative results are reported to be satisfactory, and superior, as they undoubtedly are, in the lower charges for better accommodation to the public.

17,202. Your views seem to be founded on an analogy between an ordinary highway and a railway, but can that be said to hold good when a highway can be used by each individual according to the ordinary mode of user without any special restraint or control, and a railway cannot be used by an individual at all, nor can it be used by numbers combined except under very great restraint, and subject to very great control?—I see no essential or practical distinction in the difference pointed out. Everybody knows that whilst a highway was open for anybody to enter and use, with their own carriages, but as to railways, that the original notion of letting carriers use their own locomotives on them as public highways was found to be impracticable. But it was not impracticable so to arrange that carriers might use the railway carriages and the railway locomotive power solely at the cost of the service for them. Such arrangements might be made that no private carrier would have any advantage in using his own trucks for his own goods.

17,203. Still the user, which is the practical result for which the roads are made, seems to be in every essential characteristic not merely distinct but positively antagonistic?—The fact of a thing being done is evidence of its possibility, and the fact of its having been done on the continent with great advantage to their transit, private as well as public, I think is conclusive evidence that it may be done here. And that fact of actual practice, I apprehend, is conclusive as to the futility of any such imaginary distinction.

17,204. When it is done it is done by the Government, who have not merely the duty of constructing the road, but the duty of carrying everything along the road?—No such thing is proposed as that it should be done directly by the Government as assumed. It is proposed that it should be done, by letting out the work to contractors in various ways, and which may I think be wisely inquired into. I consider that the various ways in which it has been done ought to be re-examined on the spot by impartial and competent assistant commissioners, when it will, I believe, be found to have been done in various ways, some better than others, some, by letting the entire service out to contractors to work, as well as sometimes to contractors for the rolling stock, and sometimes for the maintenance of the way.

17,205. When you have let out the exclusive user of the road the mere construction becomes immaterial. As regards the general public the company would

have the exclusive use of the road?—In France, although letting out the railroads to public companies, the Government does so only under a constant surveillance of officers responsible to the public through the Government. There is a distinct set of officers, who are called Commissionnaires de surveillance administratif, who are to be found in every important station; who receive the complaints of travellers, and see that the various articles of the cahier des charges are properly carried out. Then there are besides these the Engineers de contrôle to see to all the general matters connected with the traffic, the security of the travellers, and the good state of the material. This surveillance on the part of the public is of important use and security, I believe, also to the capitalists.

17,206. In France the concessionnaires still use the railway for profit and loss with a varying dividend?—Yes.

17,207. If that plan is adopted how do you reconcile that with the view with which I understood you to begin, that there was no profit or loss to be taken into account?—I consider it to be a better working of a principle which is objectionable in itself, and I may have to submit to my colleagues of the Institute, that they have, for the reasons I have stated, been in error in France in following our example, and allowing intercommunication to be charged or weighted for trading profits or for taxes; I submit that such charges beyond services are economically wasteful.

17,208. In the other cases which you have mentioned on the continent, not in France, is the system precisely the same that a railway is let out to a company having the exclusive use of it, to work it at a profit or loss?—In some cases it is so.

17,209. In those cases, therefore, there is still the objectionable element of profit?—I think so.

17,210. Do you know of any case in which a railway is administered without reference to any profit?—If you make inquiries I think there will be found to be many cases in which a railway has been formed without that element, and worked in the same way as a highway is worked.

17,211. Still in those cases where the element of profit does not come into account, is it not the case that where the Government itself administers the railway it exercises complete control over the whole of the transit by railway?—It maintains, as part of the general system, the general governmental duty of the protection of the public, as on the public highways. In every part of France the French public are protected, in the case of all these private companies, by public officers whom I described as Commissionnaires de surveillance, to whom you may complain upon general matters, and with regard to safety there is the Engineer de contrôle.

17,212. Upon the French railways have the concessionnaires the right, within their maximum rates, to regulate the charges they will make?—I believe in the conditions of the concession, and they are only available by an authoritative alteration of the cahier.

17,213. Within that they are at liberty to settle any rate they please?—On particular occasions, during festivals in France, and at the time of the Exposition in Paris, at the instance of the Government, the fares and charges on the railways were much lowered on some lines. The companies were at liberty to return to the ordinary charge, but they found that they had made so much by the increased traffic by the enforced reductions that they have not gone back to the old rates. Although the fares are much lower, and the quality of the service higher in France than it is here, there is an agitation to get the fares still lower.

17,214. Is not the right of a company based upon the rate of tolls given in the concession, and within those limits is it not entitled to exercise the ordinary rights of property, by fixing the toll it will take?—I believe they have never in France, nor, so far as I am aware, in any other State, gone so far as to confer the ordinary rights of property on the public necessities in the means of conveyance. I submit that the Commissioners would do well to send competent inspectors over to France, as well as to other places, to see how they have worked out the system of public control over private commercial companies.

17,215. How would you carry out your system of constructing railways so that there should be no profit, but that the income should merely pay the expense of the system. You have stated that they are all based upon the principle of profit?—We must deal with the existing system as we find it, and retrieve the errors in principle as we may in respect to past works. But I think we have only arrived midway in the requirements of the country. And in respect to the future, a large amount of agricultural and other traffic still remains undeveloped, and there is a large probability that there is as much to be done for the future as has been done for the past, and this service should, I submit, be rendered on correct principles by an improved, responsible, and cheap procedure, and for charges, as for a service and not for profits, as in the case of well-administered highways, as of old.

17,216. How would you proceed with the construction of new railways in this country, would you proceed on the principle that you have laid down of constructing them by contractors who were not to look to profit, but merely to repay the cost of construction?—Just the same as in the case of a town; the authorities apply for power to borrow money, and they spread the charges over a series of years, and they apply for authoritative and competent sanction. Then having obtained the proper sanction to borrow money, and spread the charge over a term of years, they may execute the works by their own engineer, or their own contractors, subject to proper supervision for the prevention of waste, and the protection of absentees and reversioners. In the case of branch railways forming part of a general system, due control would be exercised to ensure uniformity to that system.

17,217. (*Sir R. Hill.*) Are you acquainted with the system of gas-lighting which has been established in Manchester?—Yes.

17,218. Does not that furnish an instance in illustration of what you have been urging upon the attention of the Commissioners?—Yes.

17,219. Where a work is undertaken not with a view to profit on the point of the undertakers, but with a view to the advantage of the public at large?—Yes; and so also with respect to waterworks.

17,220. Can you state to the Commissioners some of the results of the system introduced at Manchester in the supply of gas?—The last results of which I was informed was that the average profit to the town was upwards of 20,000*l.*, and with the proceeds, or from the savings, which would otherwise have gone as a dividend to private companies, they paid for the widening of the streets, and for local works of improvement.

17,221. The profit obtained in that case was devoted to the improvement of the city?—Yes.

17,222. The gas supplied being of a very excellent description, and sold to consumers at a very moderate rate?—Yes; I was informed that it was so, but my impression was that they would gain more if they sold the gas at a yet lower rate, and they do not charge more than a private company would.

17,223. (*Mr. Horsfall.*) What is the charge per 1,000 cubic feet?—I think the general charge was, speaking from memory, about 4*s.* 1,000 cubic feet.

17,224. (*Mr. Ayrton.*) 4*s.* 1,000 cubic feet is the maximum rate, is it?—Yes.

17,225. (*Sir R. Hill.*) If railways were made by the State, or by the owners of the land in a particular district, you would recommend, as I understand you, that they should be leased out to be worked?—Yes.

17,226. In drawing out a lease for that purpose I presume stipulations must be made as to the maximum charge which the lessee would be entitled to make?—Certainly.

Mr. E. Chadwick, C.B.

10 May 1866.

17,227. Competition might be invited from the public for those leases, and that competition might be made to depend upon the question as to which of the several competitors would make the largest reductions in the charges?—Yes.

17,228. Then supposing a lease to be granted to an individual, or to a company that was willing to work the line upon the most advantagious terms to the public, any profit that the lessee might obtain would in effect be a payment for his services, and for the services of his subordinate officers?—Precisely; and such a system, would have this advantage, that the work would be let out, would get rid of the opposition that is raised here, although I do not think well founded, whilst open competitions are available against handing over private directors' patronage to the Government.

17,229. Under such circumstances would not the public be likely to obtain the lowest charges for which a railway could possibly be worked?—Certainly, and the wider the area of the service embraced to which it was applicable, whether by a private trading company or an individual contractor, the greater would be the economy. I should confidently expect that what Mr. Bidder stated is correct, viz., that if the railways in Ireland were let out to contracting parties to work them, two trucks or two carriages would be made to do the services of three, for there is an enormous economy to be obtained in that respect.

17,230. Under such an arrangement as that the public would obtain the advantages of competition?—Undoubtedly.

17,231. But the competition would be, to use your own expression, competition for the field, and not competition within the field?—Yes, and that touches on one large objection that I have made to the course of legislation in this country. I consider that the views of the commercial people who have gone into these speculations have been thoroughly wrong, commercially and economically wrong, for that the competition of two capitals or three capitals within one field that may be served by one must end in waste, and generally speaking that waste is charged upon the public.

17,232. You are no doubt aware that in the suburbs of London the toll bars are being and have been removed from the roads?—Yes, from an increasing perception that payments for roads by tolls are erroneous in principle.

17,233. Are you aware that this has been done also to some extent in Scotland?—Yes.

17,234. It has been done, I believe, almost universally in Switzerland by the several cantons?—Yes.

17,235. Do not these facts tend to support the view which you have taken, that the high roads may be worked with a view to the general advantage of the community, and not to the particular advantage of any individual, and that tolls need not be taken under such circumstances?—I believe, looking at the results which are obtained in all these cases with reference to the improved value of land and the development of agriculture, the increase of manufactures, the cheapening of distribution, and the general increase of intercommunication, it is quite demonstrative of the course to be taken if the evidence is looked at impartially and fairly.

17,236. (*Mr. Ayrton.*) Is there any difficulty whatever in any body of persons applying to Parliament for powers to make a railway on the principle you have suggested, precisely as towns have applied to Parliament for powers to supply gas and water?—The first and fatal difficulty is the cost and uncertain character of the procedure;—the enormous cost of obtaining an Act of Parliament, and the uncertainty as to the sort of opposition which may be generated.

17,237. But that would be equally applicable to a gas or water bill?—I think that it is a great detriment to all local works and local improvements of every description, and that the whole of the expense connected with the parliamentary procedure is scandalous. I met abroad a Prussian administrator with some others, who were urging against our form of the parliamentary Government the enormous cost at which any legislation for the public benefit or for localities was obtainable, and they put it in this way, "We have to do only with our bureau, a few memorials to draw up, and a little paper war to go through, and then we get a concession, but with you, or with America, you have two mobs to fight through, and to bribe half of them."*

17,238. Do you see no difference between a company to supply gas or water, and a railway company in all these circumstances?—Not at all, to affect the question.

17,239. You think that the analogy is complete?—I think that in the case of gas being distributed through the public ways, and looking at all the points of economy in the distribution of gas, there is upon principle a sufficient analogy to the distribution of goods or passengers.

17,240. Do you think that there is not this difference, that a gas system or a water system is complete in itself for the supply of a town, while a railway system would be of no use unless it were connected with other systems?—Instead of that connexion being an objection to the procedure I propose, it appears to me that it is an additional advantage, because it supplies the means, now by gross default omitted, of connecting the the local work, and completing its connexion with the general system of the country, to the local as well as the general advantage, for the more speedy and cheaper transit of passengers and goods throughout the country, at this time the great desideratum.

17,241. Do you not see any difference in this respect, that the gas and the water are turned into every house according to individual requirements, while a railway can by no possibility be turned into every house, or into any house according to individual requirements?—I clearly see this result as attainable by the removal of legislative obstructions, and by appropriate administrative arrangements, on correct principles, that the present jarring disconnected mess may be superseded, and that goods may be brought into every house, and that from every house everybody may be made free to go to any distance with a degree of convenience, economy, and safety now rarely experienced.

17,242. Do you think it is practicable to make a railway with a siding into every house?—I submit that I have said nothing to justify the assumption that I have supposed that railways might be carried into houses. But I do suppose that economies in the means of transit which have been achieved elsewhere might be achieved here; that it is practicable to bring railways by branches nearer to towns, and in some instances, by horse railways (or by tramways) applicable to ordinary vehicles, to bring that mode of conveyance into wide leading thoroughfares, and before the doors of shops and warehouses, by omnibuses, and the like means to take persons from them readily and cheaply, instead of inconveniently and comparatively extravagantly, as at present.

17,243. Do you not think that the individual use and enjoyment which exist in the case of ordinary roads, and of gas and water, but which do not exist in the case of railways, make a very essential difference in the character of the two undertakings?—Only very largely on the side of the railway. There is one proposition I wish to state which connects itself with the formation of branch railways, especially for certain districts, which is that the present incomplete and disjointed condition of railway communication greatly impedes the whole retail distribution of the country. I allude to the foreign parcel post system. The separation of the main lines of communication in the country from the postal system has been exceedingly detrimental in this country, by hindering the conveyance of small

* Note afterwards added by the witness. "For they cannot be persuaded that the enormous expenditure in obtaining concessions is not in reality bribery."

parcels, and hindering a great deal of the development of retail trade. In Switzerland, in Belgium, and other continental States, it will, believe, be found to have been worked out with very considerable results. I have only been enabled to inquire into it in Switzerland, where a cheap system of small parcel post in connexion with a cheap and uniform system of postal telegraphy is producing a great and beneficial change in the retail and wholesale trade of the country. In Switzerland there is no labour of inquiry to find where and how any small parcel may be sent. Every post office is a receiving house, and every letter carrier a deliverer at a small rate of charge for the convenient and responsible service. As illustrative of the disjointed means of transit in England I may cite the following passage from our report, at the Society of Arts, in 1858, since which time the system has not, I believe, been materially improved, except on some few lines:—"A small "parcel to be transmitted from the Land's End to "May near Thurso must be conveyed,—1, by one "foot messenger from the Land's End to St. Buryan; "2, by another foot messenger from St. Buryan to "Penzance; 3, from Penzance to Truro by mail cart; "4, from Truro to Plymouth by mail coach; 5, from "Plymouth to Exeter by South Devon Railway; 6, "from Exeter to Bristol by the Bristol and Exeter "Railway; 7, from Bristol to Tamworth by the "Midland Railway; 8, from Tamworth to Preston "by the London and North-western Railway; 9, "from Preston to Carlisle by the Lancaster and "Carlisle Railway; 10, from Carlisle to Greenhill "by the Caledonian Railway; 11, from Greenhill "to Perth by the South Central Railway; 12, from "Perth to Aberdeen by the Scottish North-eastern "Railway; 13, from Aberdeen to Keith by the "Great North of Scotland Railway; 14, from Keith "to Elgin by coach; 15, from Elgin to Inverness by "the Inverness and Aberdeen Junction Railway; "16, from Inverness to the south side of the Meikle "Terry near Tain by mail; 17, from the south to "the north side of Terry by a boat; 18, from "Terry to Thurso by mail coach; 19, from Thurso "to May by messenger.

"Take the case of the need of transmission of a "small parcel from the Land's End to another ex-"tremity of the United Kingdom, as to Valencia in "Ireland, it must be conveyed by the seven distinct "changes of carriers to Tamworth, and then it "must, 8, from Tamworth to Chester by the London "and North-western Railway; 9, from Chester to "Holyhead by the Chester and Holyhead Railway; "10, from Holyhead to Kingstown by the mail "packet; 11, from Kingstown to Dublin by the "Kingstown and Dublin Railway; 12, from Dublin "to Mallow by the Great Southern and Western "Railway; 13, from Mallow to Killarney by the "mail car; 14, from Killarney to Cahirciveen by "another mail car; 15, from Cahirciveen to Va-"lencia by foot messenger. A parcel from May, "near Thurso, for Valencia must be conveyed by "eleven different changes or different carriers to "Preston; and from Preston to Chester it would "be conveyed by the London and North-western "Railway; and from Chester to Valencia by the "several changes above mentioned, making in all "19 changes."

17,244. Do you think that that difficulty would be got over if there were independent bodies of commissioners acting in all the smaller districts, without any regard to profit, or any other responsibility than that which depended upon their sense of public duty?—I do not conceive action by independent bodies or individuals, but by dependent bodies or individuals acting as mail coach contractors in dependence and adaptation to the general system, on condition of the concession of low rates for the service for the advantage of the people of the locality as well as of the general public.

17,245. Do you think that those commissioners would be more likely to look to the public service if acting without any profit or interest from a sense of public duty?—We do not propose that they should act from any sense but that of their own interest as provided for in instances of a proper contract.

17,246. If there was no profit concerned what would be their motive for action?—They might and ought to have a profit or payment proportioned to the amount of service rendered. It is, I apprehend, a default in English administration that he who does much is allowed no more than he who does little, and that the piecework principle is not duly applied. In France, on the Paris and Orleans line, I have heard there has been a commencement made to remedy this default by payment, as piecework, over and above a minimum salary, proportioned to the amount of goods or passenger traffic. A double traffic would there be productive of an increase of emolument to them, here the double traffic would impose double labour upon all the employés without any advantage to themselves, and I believe that default in that respect has prevented many improvements being made in England. In some cases important reductions of rates have been made, where from my own knowledge the advantage to the public has been enormously increased, as much as three or fourfold, but where as they have not been immediately attended with any material increase of profit to the commercial shareholders, and only with a great increase of trouble without any compensation to the railway staff and labourers; of course all of those are combined as a dead weight to stop improvement on that account.

17,247. Do you not think it is probable that no application has been made to Parliament to construct a railway according to your system because those who were most competent to judge, the commercial people in large towns, deemed it to be wholly impracticable?—It is not within my observation that the commercial mind has on economical or even on commercial principles, the pre-eminence claimed for it, on such subjects as the present. Indeed, it may be proved that in questions of civil administration it has largely to be informed, especially as respects the law of the increasing range of consumption, with a diminishing range of price. As instances that immediately occur to me the commercial directors of the gas companies in London were forced to make reductions of charges, which have answered in defiance of their own anticipations; all the gas companies said that if the price of their gas was reduced from 12*s.* to 4*s.* per 1,000 cubic feet, as proposed, they would be ruined; they all believed it, but it turned out, at the reduced price, to be far more profitable than it ever was before. In the same way with commercial directors of canal companies, canal proprietors; they have alleged that to reduce their charge of 2*s.* 6*d.* per ton to anything less would be ruin to them. They were forced to charge 6*d.* *only* per ton, but that has given them a greater profit than before.

17,248. Are you aware that the gas companies have been deprived of the means of competition by having an exclusive monopoly given to them, and that upon that basis a reduction of their charges has been obtained?—The method of controlling the supply of gas in in London is exceedingly imperfect as compared with the reform which has been effected with regard to the gas companies of Paris. I believe that by following the example set there the reform in London may be carried much further than it has been.

17,249. Are you also aware that in dealing with gas companies in this manner Parliament has been compelled to impose upon them the most minute restrictions as to the nature and quality of the gas and other conditions which entirely withdraw from them any discretion?—I have not been able to observe the details of the legislation in respect to the supply of gas in the metropolis, I have only observed the complaints of its extreme, gas of inferior qualities than those promised, and at higher prices than with good legislation and administration might be obtained.

17,250. Do you not observe that we are enabled to do this because we are dealing with one single commodity which has a certain simplicity in all its

Mr. E. Chadwick, C.B.

10 May 1866.

arrangements, and that these views would be wholly inapplicable to a railway, which is an extremely complex and varied undertaking ?—Railway administration I look upon as a general system more or less simple in its principles and properly understood in their application, though multiform in their details. That has been found to be the case abroad, and I am sure with equal administrative skill or legislative attention it will be found to be so here.

17,251. Are you not aware that in practice, so far from that appearing to be the case, every day shows that the subject is becoming more and more complex, and that new duties and new obligations have to be undertaken by railway companies to satisfy the public wants far beyond the original conception of their undertakings ?—I can only reply in general terms that I think there are numerous defaults in principle and in action, and that a fair examination and comparison by competent inquirers of what is done abroad will show what may be done here.

17,252. (*Capt. Galton.*) You spoke of the French railway system as being so perfect ?—I beg pardon ; I did not speak of it as perfect.

17,253. Are you aware that a French commission sat in 1863 and examined most attentively all the grievances of the public in France, and that it appears from their report that the delays and inconvenience with regard to the merchandise transmitted on the French railways are very great indeed, and that if they could resort to the English system of not having fixed charges but special rates, that many of those grievances would be removed ?—It is an assumption I repudiate that the French system is considered, even in France, to be supremely perfect. I know that so far as they have followed the example of England in France it is generally admitted by French administrators that they have been misled. There is an agitation now in France represented by the book I hold in my hand, "La Reforme des Tarifs des "Chemins de fer et les Compeignies, par Gustave "Marqfoy. Paris, 1864," on the need of the reform, and the further reduction even of their reduced tariffs. They are beginning to see the importance of complete works and reduced charges in goods and packages, for the improvement of agricultural production, for the cheaper dimentation of their cities, as well as for their manufactures and trade. I think that a small parcels delivery is of very great importance to agriculturists and particularly to towns, especially in connexion with a cheap telegraph post. For the delivery of small parcels our Post Office has 10,000 stations which may be utilized as they are in Switzerland, and I believe in other places, for the collection and distribution of parcels. No separate companies or company independent body can get up either a separate distribution or a separate collection except by separate establishments. They must have 10,000 separate collecting and distributing places and 10,000 establishments paying separate rents, and in fact everything must be separate. The utilization of these establishments also governs the question of the cheap telegraphic post. You cannot set up a telegraph without having to pay a separate rent, having separate offices, and separate establishment charges. All the Post Offices in Switzerland are utilized in the way I have described for the public service, and hence they can do that cheaply which cannot be done other than dearly by any separate establishment whatsoever. In Switzerland the effect of this combination of the parcel post with the postal telegraphy, has been to enormously diminish the amount of the stocks kept in the retail shops. I am informed that traders do as much now with these facilities with one capital as they formerly did with five, because they can send at once and supply themselves with stock just as they want it. It is beginning to be the same with England. In wholesale dealing by the aid of the telegraph one-fifth of the capital is now in some instances being made to suffice ; but the high tariffs hinder the application of the principle to retail trades which cannot bear the cost. If the Swiss system were adopted in Manchester the business of some of the larger houses would be increased tenfold, because the retail distributors would send for the articles as they wanted them, and so have them fresh and fresh. Even now the system is beginning to be applied in London by means of private telegraphs. A druggist at the west end of the town, instead of keeping a large stock of medicines, sends to the central depôt in the city by telegram, and gets his medicines fresh and fresh ; and I believe the same thing is done in some other trades. That is now being done in Manchester. There is a large grocer's shop in the centre of the town kept I think by a company. They have telegraph stations in several of the suburbs ; anybody in the suburbs goes to the station, gives his order for what he wants, and it is telegraphed for and sent. Assuming there are lower establishment charges for stations than there must be with separate shops, with full stocks in them and servants and higher rents, the company, instead of carrying on the business of retail distribution at a cost of 25 per cent. or 30 per cent. to the consumer, are enabled to do it at 10 per cent. There is no doubt that, looking at these examples on the continent, that the reform of the railway system in this country is of enormous importance to retail distribution of every kind, even agricultural produce. Instead of sending the produce to the markets the farmers and other people would send direct to their customers in town, if a cheap parcels delivery were established, combined with the facilities, which are found in Switzerland to be very great, of ordering by telegraph in cases where the supplies are needed with speed.

17,254. What is there to prevent sending orders by telegraph in England now, because the price of a telegram, say from London to Birmingham, is not dearer than the price of a telegram in Switzerland ?—The uniform rate in Switzerland is a franc, and that they are proposing to lower ; here the charge is only a shilling for particular lines, but here the separate telegraph stations being comparatively few, about 1 to 10 as compared with the postal stations, the distance and the cost of messengers from the stations is great, and the price of a telegraphic message in the country anywhere out of the large towns is generally 2*s.* 6*d.*, and often much more.

17,255. The price of a message from London to Birmingham, or from London to Worcester, and all the towns within that radius is 1*s.* ?—I am charged for a telegraphic message from Richmond, which is only eight miles, 1*s.* 6*d.* ; to other by-places it is 2*s.*, 2*s.* 6*d.*, and even 3*s.*, on account of the messengers. They have half franc messages all over Belgium, which it is impossible to have in England, because the main lines for the telegraphs, the railways, are in the possession of private companies, and there must also be separate receiving offices and separate deliveries, and establishments for the separate trading telegraph companies.

17,256. If a person resides at any distance from a telegraph station, there is added to that franc message another franc for the cost of conveyance ?—There may be in some instances, but the distances are generally so short as not, I believe, to warrant additional charges for delivery.

17,257. Is not the reason of the charge of a telegram to you at Richmond being 1*s.* 6*d.*, because 6*d.* is added as the cost of the messenger from the station ?—Yes, but the distance from the postal station would be less. I could not have a station at the top of Richmond Hill for a telegraph company. At Petersham and other places far on in the interior of the county where there are post offices there might be telegraphs in union with the Post ; but there could not be any profit for separate company ; and that makes the distinction. The economical law of an increasing ratio of consumption with a reducing ratio of price exemplified in the case of the letter post applies to the telegraph post. In Paris they have recently reduced the charge of a telegraphic message from a franc to half a franc, and the increase has been tenfold. In Belgium they are reducing the railway

charges, the postal charges, and the telegraphic charges. They have recently reduced the uniform telegraph rate from a franc to half a franc all over Belgium, and in two months the net revenue has been increased.

17,258. (*Earl of Belmore.*) How would a cheap parcel post enable farmers to send their produce, which is generally of a bulky nature?—There are two sets of parcels, large and small in the continental states; the small ones, which may be delivered by hand, are delivered by the letter carrier; the larger ones are delivered otherwise. It might be so in England; and farmers and market gardeners might supply customers direct, at great distances by railway, on uniform and reduced rates. In my house we get potatoes direct from a farm in Lincolnshire, because it happened to be convenient. They had tried to get butter and other supplies from a farm in Devonshire, and cheese from a favourite dairy in another county; but the trouble and expense were prohibitory. These small wants to the many are shown by the progress in some parts of the continent to be very large, dispensing with intermediate agency. The cost of retail distribution is often 25 or 30 per cent., or greatly beyond what would be needed. A large proportion of the retail distribution might be effected at probably half the charge to the benefit of the market gardener or the farmer as well as the consumer.

17,259. Do I understand you to say that you think it would be advisable that the Post Office should undertake the transmission of parcels of that description as well as letters?—The principle I propose is that of utilizing the public postal establishments here as on the continent, and, here as there, connecting the railways with the postal administration. It would, I conceive, be desirable that assistant commissioners should be sent there to examine the practical working of the system. Our own disjointed and more expensive means of communication are, I believe, acting prejudicially against us abroad. For instance, for Switzerland they have two markets for silk, the one at Liverpool from Japan, the other in Italy. The cheaper telegraphic communication to Italy, and the greater facilities of railway transit on the continent, are, as I am informed, telling for the Italian market and against our own.

17,260. (*Chairman.*) Will you proceed to point out any further disadvantages which you consider are attributable to the present system of railway legislation in this country?—Besides the obstacles which it presents to the extensive development of branch lines, and rural as well as certain tramways, (the capillaries to the main arteries of circulation which it clogs and keeps disjointed,) it creates obstacles to speedy transit and distribution by a cheap postal telegraph in speeding the transit of commodities in detail as well as in bulk; for, by raising a post by telegraph for retail or wholesale distribution, by effecting in one day a transit which now requires two, or in half a day what now requires two, you do what is equivalent to doubling the speed of the quickest railways, besides impeding enormous economies of wholesale and retail stocks; the present legislation impedes the location of manufactures and the distribution of labour. Take the example of pottery. I am afraid that if potteries were to be set up *de novo*, it would be found cheaper to take the coal to the clay than it is to take the clay to the coal. Potteries might be established near the good seats of clay, as in the interiors of Dorsetshire, Devonshire, and elsewhere. I believe the present system in its disjointed and dear state does very powerfully affect the distribution of manufactures.

17,261. (*Mr. Ayrton.*) Let us take that illustration. Do you know the relative weights of coal and china clay and the saggers in which the china clay is baked?—I do not remember the particulars. I had occasion, when examining the manufacture of drain pipes for cities and towns, to go into it sometime back. Since I introduced those drain pipes I believe that about 12,000 miles of them have been manufactured in Lambeth alone.

17,262. (*Capt. Galton.*) Are you not aware that very large pottery works exist at Poole?—They exist at Poole, where there is water as well as railway conveyance, but suitable clay exists in places in the interior, where there is neither.

17,263. (*Mr. Ayrton.*) Is it not the case that where the manufacture is of coarse material, and the weight of the clay is considerable, that it is desirable to carry it on where the clay exists; but in the case of the finer clays, such as china, you have only china on the one side, and the double element of the clay for the saggers as well as the coal, and in that case the weight of the coal is of course greater than the weight of the china clay?—I have stated the conclusion of experts, or of the potters themselves, which is, that it is cheaper to take the coal to the clay. I may mention in connexion with this point that I am assured upon good authority that the business of refining sugars is going from London in consequence of the railway charges.

17,264. Do you not think that the business of refining sugars is being transferred from London owing to two causes; first, the cheapness of coal in the north, and secondly the development of the colonial trade at the two ports of Glasgow and Liverpool as compared with the old location of the colonial trade at London and Bristol?—I refer to the evidence of the sugar refiners themselves, and I rely upon that. It will be found, when impartially examined, that the time and cost of transit governs the location of manufacturers extensively. It has largely governed the distribution of cotton manufactures. Eligible sites are presented in rural districts for cotton or other textile manufacturers, sometimes from the convenience of water power, sometimes the cheapness of provisions or labour, but they are rendered ineligible by the distance and the cost of transit, which branch or cheap horse railways would reduce. The cheap coal of Yorkshire has tended to draw the woollen manufacturers from the western counties, which cheap transit might to some extent restore to them. As a general rule, I think it admits of no dispute by any impartial person who examines the subject fairly that the present state of railway communication in the country is a great hindrance to the distribution of manufactories as well as of labour.

17,265. (*Capt. Galton.*) Do not railway companies facilitate the establishment of manufactories on their lines by giving special low rates to the manufacturers to establish them?—They may do so in particular instances, but that special low rate is only an exemplification of what ought not to be special or exceptional and upon favour, but general as a common public right.

17,266. (*Earl of Belmore.*) Am I to understand you to say that you think it is advisable that branch railways in this country should be made upon the same principle that public roads are now made in Ireland, namely, out of the public rates, and that after they are made that they should be maintained out of the public rates?—Certainly it is demonstrably the most correct course; correct in economical and legislative principle that all charges on transit or intercommunication of the nature of costs should be jealously reduced; that all payments in the shape of profits beyond the bare cost of proper service should for the future be rigidly excluded as commercially wasteful and politically mischievous. The trunk lines may be economically aided by subventions from the general public or by the state—the branch lines by the local public. The Irish Railway Commissioners, Captain Drummond, Sir John Burgoyne, and their colleagues, proposed what is now regretted, as the correct principle, which will be more regretted, as a return to them is delayed, that the general railways should be so provided for, the branch lines by advances secured on local or baronial rates, or rates coincident with the immediate benefits.

17,267. (*Sir R. Hill.*) You think the rating should fall on the district which is benefited?—Yes.

Mr. E. Chadwick, C.B.

10 May 1866.

17,268. And as nearly as practicable in proportion to the benefit conferred ?—Yes.

17,269. (*Earl of Belmore.*) Are you aware that that is the principle which is adopted in Ireland where counties are divided into small divisions called baronies, and the expenses of the roads are charged on the baronies, but the expenses of bridges and works of that character are defrayed out of the rates of the county at large ?—The local rate, I am informed, is often not so well adapted as it might be upon such a local preliminary examination as I propose.

17,270. (*Chairman.*) Will you proceed with your next head ?—The great work of the extension and completion of railway communications by railways, the development of the capillaries of the system of which I have spoken, cannot well be made upon the basis of the existing joint lines, demonstrably worked on antagonistic and false principles. The real consolidation, or, so to speak, their ramification in the public interest, would therefore be a previous condition for adaptations by which the traffic of the trunk lines themselves would be augmented. But, in respect to those main lines, Captain Lawes, when manager of the Lancashire and Yorkshire lines, a very able administrator, in 1864 estimated the saving derivable from unity of management at 24 per cent. What it may be now, is, I submit, important matter of close special inquiry; but beyond the saving of stock, stated to be of making two trucks do the work of three or more, and the saving of establishment charges, derivable from a consolidation or a better utilization of the permanent staffs, there is the saving of time to the public, which is stated to be equivalent on cross roads to one-third, which is equivalent to an augmentation of speed, and would of itself be attended with an augmentation of traffic.

17,271. (*Capt. Galton.*) To what extent do you wish unity of management to be carried; do you think it desirable that all the railways of the country should be under one management ?—I deem it necessary in the interests of the shareholders as well as of the public, that all the railways of the country should be early brought under one control in the first instance, at least on the like principles and to the same extent as in France.

17,272. You say that unity of management will give you a certain per-centage of saving ?—Yes.

17,273. I want to know to what extent you think that unity of management should be carried. If there are three or four small railways adjoining each other, of course a great saving would be effected by unity of management; but, taking the case of the North-western, which also consists of 1,200 or 1,300 miles, would their union in one management effect any great saving ?—Probably it may even in that instance. But whether or not or to what extent could only be judged of by a close inquiry into details, which I submit is necessary to ascertain the amount with due precision for the sake of the shareholders as well as the public.

17,274. (*Sir R. Hill.*) You are no doubt, aware that in Ireland there is great subdivision of management ?—I am aware that there is there great and wasteful division of management, and jarring and conflicting action to the prejudice of the shareholders as well as of the public. Referring to the railway administration in France, I have been informed on English railway authority, that the uniformity and superiority of the accounts there inspected by responsible public officers serves as an important protection to private shareholders from such enormous defaults as we have had under railway management in England.

17,275. (*Capt. Galton.*) To what defaults are you alluding specially ?—Defaults of the Redpath kind, as well as other pecuniary defaults.

17,276. Considering the capital involved in railways, have not those defaults been very few ?—No; I think they have been very large, and I believe much larger than the public know of.

17,277. (*Mr. Horsfall.*) How would Government be able to prevent such defaults as you speak of ?—I can only answer generally, by doing as they do these things in France. The full answer to the question would involve the exposition of a system, and the mastery of it on my part. I submit that it would be a proper topic of examination in France and elsewhere on the continent. My particular English authority for what I have said on this topic was the late Sir John Easthope, who was connected with French and other foreign railways, and who was wont to say that there were in disposition as great rogues in French as English companies, but that they were kept in check in France by the superior accounts and administration there.

17,278. Sir John Easthope was chairman of a company in England, was he not ?—He was, I believe, the chairman of the London and South-western, and was connected with some French railways. I am speaking from the practical knowledge of experienced persons.

17,279. Have we not had some recent examples of default under Government management in this country ?—There are large branches of Government administration in England which have beaten all private commercial management.

17,280. Such, for instance, as the Patent Office ?—That was a case of proved default certainly, but an exceptional one, which is a favourite subject of generalization amongst commercial men as necessary and essential, whilst they have the experience of the postal service, which has not yet been exceeded, if it be equalled, by private commercial establishments in the transaction of business of extensive detail. Besides this they have the customs department, which I am assured, on commercial authority, beats after all common commercial administration. I may add, in self-vindication, that, under our own administration, works were laid out for 6,000,000*l.*, that under common commercial direction of the railway sort would have been 16,000,000*l.*; that under our direction three houses and three towns were well drained, at rates of expense heretofore named for doing one ill; that at those rates of charge the whole of the metropolis might have been drained at the expense of the outfalls which leave the mortality increasing.

17,281. You have spoken of the Customs; you are not perhaps aware that there is an opinion prevailing among the commercial classes that the Excise and Customs departments might be managed at an expense of half a million less annually than they are at present ?—My authority with respect to the Customs management is the able secretary of a body of commercial people in London, and whose object was to get reductions and adjustments, Mr. Sidney Smith.

17,282. If it is the fact that, by the amalgamation of the Customs and Inland Revenue departments, half a million annually could be saved, you would not presume to say what the result of such a charge would be ?—If such be the fact, as I must presume it is, I may only say, that the business management in the Customs being, as I am assured, on important commercial testimony, it now is, with all defaults, superior to common commercial administration, on amalgamation on correct principles would exalt the superiority yet higher; how much higher I cannot presume to say, but, as a general principle in administration, the more you have to do the better you may do any part of it, by extended and more complete classification and subdivision of labour, and by the extended distribution of establishment charges. But by default of such principle I believe it will be found that the railway amalgamations have generally been failures as respects the shareholders as well as regards the public. The amalgamations are frequently only the aggregation of one imperfect organization to another, without material change of the separate establishments. I have been assured that if the London and North-western were consolidated and methodized, from the economy which ought to be derivable from unity of management on that branch alone, something like a dividend of 1 or 1½ per cent. ought to be paid. My authority for that statement is a person of consider-

able intelligence, who had been employed on one of the amalgamated lines of that company.

17,283. (*Mr. Glyn.*) He was not in the employment of the railway company at the time?—No, he was not; he left the service of the company and is now an eminent trader on his account. But I had also the confirmatory statement of an officer who is now in the employment of one of the railway companies. There is a degree of reticence on the part of these railway companies which really prevents information being obtained. I have had a great deal of information given to me upon branches of the subject with which I had nothing to do, and therefore I have not noted the particulars, especially with regard to Lancashire and that district, from officers, from men, and from others, as to the unreality of amalgamation and the great benefit which would accrue to the public, the shareholders, and everybody concerned if amalgamations were competently carried out.

17,284. I do not quite understand your expression "unreality of amalgamation." Do you mean that there is no real connexion between companies which are apparently amalgamated?—I mean that separate establishments were kept up with separate officers acting independently, and without that combined action which is necessary for the proper transaction of the business of amalgamated companies. There were various points of that kind stated to me.

17,285. Is this knowledge which you have acquired recently obtained?—Being elected President of Department of Economy and Trade of the Association for the Promotion of Social Science, I was expected to give an address at their meeting at York the year before last, having reference to the condition of the manufacturing districts; and I paid a visit to Manchester to seek information on some points. I found reason to believe that the state of railway communication powerfully affected its present and its future, and though I was there only a few days I got more information than I could use. If an assistant Commissioner had been sent down he would have got more information than that which sufficed for me in respect to that one railway.

17,286. You are aware, perhaps, that it is managed by one board now instead of three?—It is managed in a way that is not conducive either to the interests of the shareholder or to the advantage of the public.

17,287. Can you enter into more particulars?—No, I cannot. I can only state my conclusion from what has been stated to me, and stated to me by persons who have been directors and who have resigned, and officers who have been under the management and have left, and who independently state their belief, which belief was stated last year; and further, it was stated to me by persons who are still connected with the railways; but of course I could not state anything they stated to me.

17,288. (*Mr. Hamilton.*) I think I understood you to say that more default had arisen in railway companies and railway management than the public are aware of?—So I am assured.

17,289. You mentioned it as a matter of general impression?—I rather mentioned it from information which has been given to me. It is a general impression that there has been a great deal of unexposed default. From legal proceedings lawyers know of it, and other people know of it. But there are large outside and frequent facts observed of officers living beyond their known incomes, and leaving with large fortunes beyond any known and ostensible legitimate sources for them. In the civil service, gentlemen in a subordinate position in permanent office, as a general rule, are seen living within their means. You never see them go out of office with large fortunes.

17,290. Do you infer from that fact that when railway officials have done well in the world, and civil servants have not done well, that the prosperity of the railway officials has arisen from default and from misappropriation in fact?—There was an illustrative case stated to me as occurring on the Northern circuit by a friend, which had been referred to arbitration. The case was with reference to a dissolution of partnership of a firm largely engaged in the supply of goods or materials to railway companies, and the objection of the sleeping partner was to some very large sum put down under the head of for "the improvement of the business." In justification of that charge, evidence was given that it was necessary for the "improvement of the business" to make payments, not merely to the lower class of officers, but to the very highest class of officers connected with railway management, and that the business could not be conducted without it; and the charge was allowed, as proved to be necessary for the improvement of the business.

17,291. Do you think it quite fair to make this, which is a very serious charge against railway management, merely upon common belief, unless you are prepared to substantiate the charge?—I was asked for my own impression; for the justification of my own impression is which I state, not on mere surmises of my own, but from the information of persons in a position to judge, and instances such as that stated to me as having occurred on the Northern circuit, which information I believe. It was only last week that I was speaking to a railway director of a great company, who said that some railway officers were living at double the amount of their salaries.

17,292. (*Chairman.*) Is it not the fact that railway servants at present have very large salaries indeed, as compared with the salaries in the Civil service?—Certainly some of them have. That is a fair precaution, so far as it goes, but it does not suffice without collateral administrative securities. I believe that the permanent subordinates of the Civil service who are permanent officers are in reputation, and in fact in life, the best of any in Europe.

17,293. (*Mr. Horsfall.*) And the worst paid?—Yes, I believe they are as a class most ungratefully paid.

17,294. (*Lord Stanley.*) I take the general tendency of your views to be, that so far from its being desirable to limit the action of the State within the narrowest possible bounds, it is desirable to extend it as widely as possible?—To the very widest possible, as a duty and a public service; exclude altogether the notion of commercial profit.

17,295. If you would extend that to railway matters, is there any reason why you should not extend it to such a matter as life and fire insurance? Why should not that business be taken up by the Government upon the same principle?—Life insurance is taken up by Government granting annuities. I hold a very strong doctrine about the dereliction of legislative duty on that topic also, and I say that insurance, as conducted by trading companies, is the mother of murder, of arson, and of devastation of life and property by shipwreck.

17,296. (*Mr. Horsfall.*) Is it not the fact that in many commercial monopolies there is a general allowance for insurance, and is it not the fact that everybody is obliged to contribute for insurance, and that there are no private companies?—That may be so, but what I am contending against is, that unguarded insurance leads to arson, shipwrecks, and murders. In respect to these trading railway monopolies, however, I was proceeding to submit that they are commonly conducted on a principle which is wholly unsound as a commercial principle; that nobody travels unless he is obliged, and, therefore, that lowering of the rates below the present monopoly charges will be a a loss of profit. That was the great fallacy under which the old postal service was conducted, that nobody wrote unless he was obliged; and a sort of practical men predicted that any lowering of the revenue would be a pure loss that could not be retrieved. The abrogation of this false commercial principle of the commercial directors of railways, which may only be done under unity of management, will be productive of the like beneficial results in the intercommunication

Mr. E. Chadwick, C.B.

10 May 1866.

of the country. In Paris an example was furnished of the principle on which defaults in the legislation and administration of the public means of communication are retrievable. A French administrator perceived two omnibuses running through the streets to the same points half empty, or three doing badly a service that might be better done by two. In fact, that there was a third capital wasted, and that he could save this third capital, and divide it between the shareholders of the omnibuses and the public: to the omnibus shareholders in somewhat better dividends, and in security for the future to the public, in that case chiefly in improved accommodation, and at some points lower fares, and at all points fixed fares. Having made good his case to the legislative authority, there was a proper legislative intervention, by which the unity of management and the economy and convenience from unity was effected, and the value of the shares was enhanced by the new security, I believe, by one-third. In respect to the supply of gas by seven conflicting trading companies, unity of management was effected by the like intervention on the like principles, with a reduction of the prices to the consumer of 30 per cent. and to the public of 40 per cent., and the shares were augmented in value at that time 24 per cent. or more. Those amalgamations were thought to be so strongly for the general benefit, which has been clear and patent, that there has been an expectation that the French Government would apply those principles to a more complete amalgamation of the railway systems even than that which exists at present, and in favour also of lower fares.

17,297. (*Chairman.*) What practical steps would you take in the present state of railway matters in England to carry your views into effect, considering the thousands of miles already made?—The first practical step I would take would be to direct closer and more particular local and special inquiries on the chief topics for the preparation of safe legislative measures. My belief is, that this has even yet to be done, and I must ask pardon if, speaking as an old commissioner of inquiry, I express my conviction that this cannot be done by the Commission with its present procedure. Those large commissions on which I have had the honour to serve with commissioners in high public positions, who could only give divided and irregular attention to such evidence as might be brought before them in London, would all have failed, would not have got the most important information, if we had not employed competent assistant commissioners to give the requisite undivided attention, and conduct uninterruptedly the inquiries into special branches of the subject, and, above all, to make close local inquiries. My knowledge and experience upon this subject, gained though incidentally at Manchester, at Sheffield and elsewhere, convinces me that there is a large amount of evidence which a competent person down there to inquire as an assistant commissioner would get out, but which the commissioners themselves sitting here have not got and cannot get. An assistant commissioner might have got out clearly and undoubtedly such evidence as that which, having no authority, I am only enabled to indicate. I believe also that if an assistant commissioner were sent over to Ireland two objects would be achieved, one to inform the local public, to get better and clearer evidence as to their wants and conveniences, and of the traffic which may be got at lower fares, and as to the districts which may be opened up by cheap branches, and more close evidence as to the loss from disunity and the gain from unity; the local public would get informed of what you are doing, and, besides that, you would also inform the local shareholders, both of whom have to be informed on this matter.

17,298. (*Capt. Galton.*) Inform them of what?—They could be informed, for instance, of the additional traffic that might be got by new arrangements, and particularly now as to the reduction possible by getting loans at the prices of the Government securities. It is perfectly fair to charge rates in profits in trade. The gains derivable from getting rid of local taxation and of the gain in security to the property for the future, by a return to correct principle, in placing the means of communication under responsible public management. It appears to me that, as one branch of inquiry, no proper account has yet been taken of the utter violation of all correct principle, the subjection of the means of transit to capricious and excessive local as well as general taxation; the excessive charges for land and the other evils that are incurred by the false basis profit on which the railways have been allowed to be placed as speculations for trading. It is as preposterous to charge the means of communication by railway with taxes, if they were on the legitimate footing, as it would be to tax the public highways over and above even any tolls levied for maintaining them.

17,299. (*Earl of Belmore.*) Are you aware that in Ireland the roads are practically charged, that is to say, that the owners of the land adjoining a road on either side have to pay the expense of keeping that road in repair?—I am aware of the fact, but I am speaking chiefly in respect to the condition of railway administration in England. Speaking as a Poor Law administrator, I am of opinion that the parochial taxation upon the railways passing through them is of no adequate advantage as a contribution to the rates. It is like rates in aid; it is a sort of out-door relief or assistance to the parish, that is generally mischievous and might be abolished with advantage.

17,300. (*Chairman.*) Do you think as long as companies make profits from their lines it is reasonable that the parishes should charge them with rates?—It is no doubt fair to do so whilst the railways are allowed to remain in their present false position, which, on account of the shareholders as well as of the public, it is due to retrieve. The whole of the savings obtainable by that retrieval, as a means of compensation to the shareholders, and of relief to the public; the whole of the savings derivable from unity of management, cannot, I think, be ascertained and determined satisfactorily without close, special, and local inquiries by assistant commissioners, who would get information from witnesses who cannot be brought or heard here.

17,301. (*Capt. Galton.*) If you do away with the inducement to look at railways as a source of profit to the people who manage the railways, how would you insure their being managed so economically as they now are?—It might, I believe, be ensured much in the same way as the entire postal communication, including the great packet service, is ensured.

17,302. Are not the arrangements with the Post Office much more special than they would be with the railway companies?—Larger capitals would, no doubt, be required to be dealt with, and a considerable amalgamation effected, but I do not believe it would be so difficult a task to execute as the plan I proposed for bringing the administration, the administration of 16,000 parishes, under control, by which, though the improvement has been incomplete, a saving of two millions per annum has been accomplished, concurrently with an improvement in the relief given to the poor.

17,303. (*Sir R. Hill.*) You do not propose that Government should undertake the detailed management of railways?—Not at all; nor pretend that the reform should be worked out by any changing and irresponsible political chief, nor as an incident to the functions of any old existing department. It should be worked out so as to effect these great economies, in fact, to effect what I have already pointed out as a desideratum, a general amalgamation. That general amalgamation cannot be obtained upon the present basis.

17,304. I thought you said it was not to be a source of profit to the people who were engaged in this carrying trade?—They should receive payment for their services certainly.

17,305. Is not that profit?—I do not know to what extent there are now mail coach contracts, but they are a profit to the mail coach contractors. In the

same way the contracts for the conveyance of the ocean mails must be some source of profit. Payment for services I would rather call them than profit.

17,306. You would make the contractors and the different people who found the locomotives be paid for running a certain number of miles?—Just so. I would go over to some of the continental states and see the way in which they work it there, and examine the details. I think it will require a special executive commission to explore and determine more closely the means by which large economies are to be effected, and the several categories of shareholders satisfactorily dealt with, and who are often sacrificed, I believe, to the interests of the directorates. I proposed a consolidation of the seven water companies in London on the same plan as the consolidation of the seven gas companies was effected in Paris. I found we could save about 100,000*l.* a year by effecting that. That capitalized would have enabled us to have provided almost a new source of supply, and we proposed to give the shareholders security payment of their existing dividends. In that case their property would have been enhanced to the amount of a public security, but we were opposed by the directors, and by the staff's engineers, and others whose interests it was conceived did not lie in the way of consolidation. In this case I should not go to the boards of direction, but direct to the shareholders. Having ascertained what was the economy to be derived, and what security could be given, and what the benefit to their property, I would send proposals to every individual shareholder, for his assent or dissent. I think on an amalgamation, if this work was properly prepared and conducted, that not only the shareholders but the great body of the existing office bearers would be satisfied.

17,307. (*Chairman.*) Do I understand you to recommend that the railways of the country should be amalgamated by the Government becoming possessors of the whole of them, and that Government should deal with the shareholders and not with the boards of directors?—Just so; the Government should resume its duties and functions towards the public. The agency employed having duly ascertained the economy achievable and the security to be given should deal direct with the shareholders; and if their consent is to be asked to plain propositions, I believe their consent would be universal. It may be so put as to be for their benefit, as well as for the benefit of the public. I do not think you can properly prepare the public mind, or prepare yourselves adequately, without open local inquiries in the chief manufacturing and commercial sites. In all those cases to which I have alluded we were obliged to employ the assistance of local inquirers, and when I have been concerned in matters of this kind, and the Government would not allow us assistant commissioners to inquire locally, I have been obliged to go myself.

17,308. (*Mr. Horsfall.*) Do you not think that the various representatives who have been sent over from Ireland by the different railway companies, and those representatives who have been sent from the commercial community of Dublin, have fairly stated their case to us?—They may have stated the case from the directors' point of view, or from the view of the few having large interests, but I do not think that they have afforded you the fullest information about it. I quite concur in what I observed to be represented by the Mayor of Dublin, as respects Ireland, persons sep by open local inquiry, that they ought to have had sent over there, because I think Ireland would be a great deal better prepared altogether, but there appears to me much of the interests of the many and other sides of the question in which, I think, you are not sufficiently informed, both as regards the shareholders and the public, for what is needed. I have not been to a single place in which I have not met with a mass of evidence which I could get on the spot, but which nobody will come up and give here, not knowing the points of inquiry, and being indisposed to the sacrifice of time to come up and give it, even if they could all be paid. We have this further advantage in local inquiry, that there is local publicity at once. I think, in the case of the evidence which you have collected with respect to Ireland, it is a great pity that it could not have been published in the newspapers *de die in diem*. It was my practice, in all the commissions upon which I have sat, to facilitate immediate publicity and local discussion as much as possible.

The witness withdrew.

Adjourned till Tuesday next, at 12 o'clock.

The following addendum was subsequently sent in by the witness:—

ADDENDA to the Evidence given by Mr. EDWIN CHADWICK, C.B.

Central examinations before Parliamentary Committees, as compared with local examinations by responsible departments.

The enormous expense of the procedure for obtaining railway concessions in England, its very unsatisfactory character, and its failure on all essential points, and the recent efforts at amendments in the House of Lords, it appears to me, render the full consideration of the procedure which I have proposed, of local preliminary examination, of increasing importance. When I had the honour to be examined before the Commissioners, statements were made to me on points of detail of the French procedure, which I was then unprepared to answer. All I knew was of the general outcome, in lower expense, in greater efficiency, and comparative satisfaction to all parties. I had proposed, however, to write over to some official friends in Paris to ascertain the facts, when I was informed that a statement of the French procedure for giving railway concessions had been given by the late Mr. Joseph Locke in his address on his election as President of the Institution of Civil Engineers.

Local examinations in France.

As an engineer of wide practice in France, as well as in England, he had peculiar opportunities of judging from experience of both systems. His exposition is as follows:—

"You are all well aware of the preliminary steps that are required in England before a company can be incorporated for making a railway; and it may be useful to observe at once, that the Parliamentary notices, deposit of plans showing the line, standing order committees, examinations, &c., are altogether dispensed with in France, as in that country the Government has long taken the initiative in all that relates to public works.

"It has a corps of engineers well organized, presided over by the Minister of Public Works, who directs the operations of that important body known by the title of *l'Administration des Ponts et Chaussées*.

"All railway lines, therefore, must originate with, or be sanctioned by, the Government before any material steps whatever can be taken. When a ministerial decision is pronounced, declaring that a particular line would be 'of public utility,' the Minister of Public Works is authorized to enter into communication with such parties as may desire to undertake it, and, having satisfied himself of the *bona fides* and ability of those who make the most eligible offer, to enter into a preliminary treaty with them; which treaty, when approved by the Government and the Chamber, or the Senate, is ultimately signed by the Emperor, and becomes law.

"The *cahir des charges*, containing the conditions of the concession, fixing the rates of charge, and defining the relative powers of the company and the State, is settled at the same time.

"The Government, having at its disposal all the means of collecting information respecting the course of the line proposed, furnishes at all times whatever plans, sections, and estimates it may have in its possession, to the company thus formed, who then proceed to lay out the line. The *cahier des charges* allows considerable latitude in this selection—the only restriction being that the line shall pass 'by or near to' certain towns therein mentioned. The preliminary survey or *avant projet*, as it is termed, is presented, when completed, either in the whole or by depart-

Mr. E. Chadwick, C.B. 10 May 1866.

ments, to the Minister of Public Works, accompanied with a list of curves and gradients, and a full description of the line generally; and the minister, after conferring with the Conseil Général des Ponts et Chaussées, ultimately notifies his approval, through the préfet, to the company.

"In the meantime the latter are occupied in preparing plans and *états parcellaires* (parish plans and references), for each *commune* separately; showing how the roads, rivers, or streams are proposed to be crossed or deviated, and these, with a description, are sent to the préfet, who communicates them to the mayors of the *communes* respectively.

"The mayor announces, by an advertisement on the doors of the *Mairie* and the church, and by beat of drum, that the plans have been received, and that they are ready for the inspection of any parties whose lands may be affected by any of the proposed works. The plans, &c., remain thus open for inspection for eight days, during which time any person may examine and comment upon them.

"The mayor then draws up a *procès-verbal*, or report, containing all the objections that have been made, which is sent, with the plans, to the préfet. The préfet then names a commission or *enquête*, over which he presides, composed of members of the *Conseil Général* of the department, the mayors of the *communes* interested, and the company's engineer; these meet and deliberate on the observations presented by each *commune*. No person whose land is to be taken can be a member of this commission.

"A *procès-verbal*, or report on the minutes of the commission, is then drawn up and signed by the parties, adding any observations they may have to offer. This, with the plans and all documents, is sent by the préfet to the engineers of control, who are appointed by Government to report on the nature and fitness of the works to be executed by the company, and to superintend the fulfilment of all clauses in the Act of Concession. These engineers make their report. All the documents, plans, and references are then sent to the Minister of Public Works, who pronounces, under the advice of the Conseil Général des Ponts et Chaussées, finally on the company's proposition.

"The plans are then sent back, definitively corrected, to the préfet, who makes his *arrêté de cessibilité*, and declares transferable for public utility the different parcels of land shown by the references, which, from that date, are fixed for expropriation.

"The *arrête de cessibilité*, with the plans and references, is sent by the préfet to the Procureur-Impérial of the civil courts of the district in which the properties are situated, whereupon the latter makes a requisition to the tribunal for the expropriation.

"The 'tribunal civil' examines with care if all the formalities required by the company's *cahier des charges* have been rigorously fulfilled; if the *enquêtes* have been duly completed, &c.; and pronounces the judgment of expropriation.

"From this moment all the parcels of land, houses, &c., shown on the plans and references become the company's property; and all rights of the proprietor to his estate are merged in a title to compensation. He is legally divested of his property, but retains possession of it until the amount of indemnity is settled by agreement or by the jury, and is paid by the company.

"The mode of fixing the value of the land by means of juries so nearly resembles the process adopted in England that I need not trouble you with an account of it.

"The length of time necessary to enable a company to pass through these various stages is considerable, varying from six to twelve months; but, however tedious, they are not, like the preliminaries of an English railway, expensive. Nor is it necessary to do more than briefly to call your attention to the fact, so much in favour of French railway undertakings, that their mode of concession exempts them from that doubtful and onerous process which has thrown on similar works in England the enormous dead-weight represented by our well-known term, 'Parliamentary expenses.'"

Which expenses, it may be added, are, in their enormous and scandalous amounts, set down abroad, set down as mere bribery, and are held to countenance what may be challenged abroad as actual bribery, by *pots de vin* as payments to officials for concessions and profit-making commercial enterprises.

A French engineer officer informs me that, as a rule, the French concessions are given gratis.

Taking the French procedure as it stands, it is to be observed upon the comparison with the English procedure, that ours is one of centralization in its worst form—centralization to an authority that has no local information, no aptitudes for examining or deciding on such questions, and little or no individual responsibility—that it is centralization authority that can only decide upon what is brought before it, attorneys or interested parties; that has no sufficient means, except casually, of testing the validity of what is brought before it, and no proper security against the sinister character of any representations made to it, and that can only attain correct information at very great expense. In respect to time, the French procedure, though complained of as requiring from six to twelve months, has, I submit, the advantage over ours where the concession from beginning to end is rarely to be obtained in less than a year, and in case of opposition may be spread over two or three years or more. The French procedure has analogies to that which I proposed for the organization of unions of parishes, for an amended Poor Law Administration, and afterwards for local works of drainage and water supply under the Public Health Act, which last procedure, I think, has the advantage over the French procedure with respect the extent of local consultation. We did not assemble the populations of parishes by beat of drum to go and look at plans, but they were assembled very commonly by the town crier to attend meetings presided over by the engineering inspector before whom they would hear the evidence given as to the works and plans needed, and to whom anybody was at liberty to tender information or from whom he might ask for explanations. The information thus got at once, on the spot, openly, freely, and without attorney or counsel, was far superior in extent and character to much of that which is got before Parliamentary committees. No one was shut out by expense from either giving or receiving information.

Our mayors in England or our overseers of parishes, who perform functions analogous to the mayors of the French communes, are not often persons from whom the preparation of useful reports might be expected. I think the procedure I proposed, that the engineer should prepare the report comprising the information locally collected, giving that information fairly, with his own opinion upon it. His report would be printed and circulated locally before any decision was made upon it. The decision upon it would be, in the first instance, by a board, to which an appeal might be had gratis, by memorial or written, as well as verbal, representations, and which would assign reasons for its decision, on which there might be a further appeal to Parliament. I would submit that much importance is to be attached to the appointment of a competent and responsible body, which may be made answerable for sanctions to the extension of means of communication in the interests of the general public as in the interests of particular localities, and that it may be responsible, it should be found to give the reasons for its decisions, which Parliamentary committees, as a rule, do not do. Decisions without facts or reasons are frequently evasions of responsibility or resources of indolence or incapacity, or of the sinister exercise of irresponsible power. Of officers in the civil service Mr. Robert Rawlinson, the sanitary engineer, has had the widest experience of the centralized procedure for examinations before Parliamentary committees, as also of the localized procedure of examination for sanctions of works under the Public Health Act. In answer to a letter of mine, he makes the following statement of the comparative results of his practical experience:—

"Local inquiries heed not cost one-tenth the sum involved before a Parliamentary committee. On a local inquiry each witness must attend on the day named. In London witnesses must be brought up and kept waiting for days, and at times weeks. A committee may be broken up before it has completed its labours, and is frequently interrupted for several days at a time. At a local inquiry the sittings may go on from day to day to completion. Before a committee of Parliament all the witnesses are usually paid, mayors and members of town councils sometimes attend gratuitously, but all professional witnesses are paid. Before a local tribunal most of the witnesses are unpaid. A committee gives a decision without reasons; a commissioner must report and draw conclusions, make recommendations from the reports, which reports must be based on the evidence, usually published along with it.

"The great costs of fees of barristers' agents, and the other contingent Parliamentary expenses are reduced to a minimum or altogether saved at a local inquiry. If there is strong evidence on either side at a local inquiry, there are many persons ready with witness to correct it. Before a Parliamentary committee there are only the witnesses summoned and on the spot."

The procedure which I propose has analogies to parties, all the powers which they could formerly only get under expensive enclosure Acts. The superiority of that procedure in all respects over the centralized procedure before Parliamentary committees will be found to be incontestible.

An inexpensive and cheap procedure is, I submit, essential to the cheap extension of branch railways so necessary

for the completion of the general system of intercommunication throughout the country. Even if such powers were conferred gratis, and all the witnesses and parties were paid by the State for the loss of their time in coming up to London to give evidence, Parliamentary committees could not, I apprehend, be got to give the time requisite for the proper performance of such extended and multifarious business. Mr. Locke sums up the comparison between the French and English procedure in these terms: "The government of France, as we have seen, whilst "strongly controlling, has also liberally fostered this kind "of enterprise, while the English legislature, on the con- "trary, unable to guide, has suffered if not encouraged "hostile and selfish interests to encumber and pervert it. "This briefly is the sum of the question; in whatever "detail the particulars of the comparison may be pursued, "the contrast in this point of view alone is remarkable. "It is in fact a contrast between method and confusion, "in a matter of supreme national interests; there they are "led and guided by the sovereign power; here, they are "ungoverned and undefended, left to the chances of com- "petition, abandoned to every kind of attack, and only "conscious of authority in the shape of exaction." I do not consider it to go into the causes of the failure of local inquiries as to local works made under the Board of Works, the chief cause of which was that they were made supplemental to inquiries by Parliamentary committees, before whom they had no place. But I am prepared to show, as respects the inquiries under the Public Health Act, that they were discountenanced really because they succeeded too well; and interfered with, or threatened interference with, active and powerful interests in the Parliamentary procedure. If that interest is to continue to be regarded as paramount, there is an end of the prospects of any efficient reform on the topic. The opposition to the procedure under the Public Health Act was, however, one to a great extent of blind jealousy, for the local business transacted under it was for the great mass business which would not have been done at all if it had not been done cheaply, and would not have borne the professional emoluments of Parliamentary agents or professional witnesses before Parliamentary committees; and so it will be with the great mass of cheap branches and horse railways needed, as the capillaries of the national communication of the country. Mr. Locke notices the disadvantages on the French side, such as the dearness of coke and iron, which he says tells largely against them; nevertheless, from the latest accounts which I was able to get from the Board of Trade, which are set forth in the following table, the working expenses in 1857 appear to be in England 1,564*l.* per mile, as against 1,191*l.* in France. Whilst the first-class fares were in England 2·01*d.* as against 1·55*d.* in France, or it ought to be rather in comparison with the second-class carriages, which are generally considered in France, as well as in other places, equal to our first-class carriages, and in France the real second-class fares are 1·16*d.* per mile.* Still, with all these advantages, it is a matter of complaint in France, the extent to which they have followed the English example they have been in error. French legislation has followed our example in respect to the reduction of the postal charges, it has followed timidly it is true, and therefore with the delay of the restoration and augmentation of the net result.

The present opinion in France amongst those who have paid attention to the subject is represented in "La Réforme "des Tarifs de Chemins de Fer et les Compagnies, par "Gustave Margfoy." On this, referring to the example of the post, he says:—

"Un grand enseignement ressort de cet exemple (that of the post), il existe des abaissements très-utiles pour le consommateur, en même temps qu'avantageux pour l'exploitant, dont le premier effet est de faire baisser la recette nette pendant un longue période de transition. Les compagnies de chemins de fer font elles des réductions de tarifs de cette nature? Non; quoiqu'elles tiennent en mains de grands intérêts publics, la notion des abaissements utiles à longues termes n'existe pas pour elles.

"Pourquoi en est il ainsi? La raison en est simple.

"Il est une loi naturelle qui se manifeste dans tous les ordres d'idées:—c'est quil faut, pour recueillir des fruits, semer des germes et attendre. Semer des germes, en fait d'abaissements de tarifs, les compagnies l'ont, dans quelques cas spéciaux, fait avec parcimonie. Mais si elles onts pu semer quelquefois, elles n'ont jamais su attendre. Disons mieux: elles ne le peuvent pas; l'assemblée générale des actionnaires, le cours quotidien de la Bourse les pressent; il faut que la recette hebdomadaire se soutienne sans interruption, il faut que les dividendes ne subissent pas, d'une année à l'autre, des alternatives de hausse et de baisse. L'actionnaire d'aujourd'hui en effect n'est pas l'actionnaire de demain. Qu'importe la prospérité future pour autrui, en présence de la détresse présente pour soi même? Les choses étant ainsi, il faut aux compagnies des tarifs qui donnent des recettes à très-courte échéance; les tarifs utiles à longs termes sont pour elles des tarifs inutile; pourquoi semer l'hiver dans un champ qui l'été n'est plus à vous.

"C'est là un système funeste pour l'intérêt public; c'est une culture en serre chaude; elle donne des fruits hatifs mais atrophies. Ainsi, dans tous les cas où les abaissements à longs termes sont sollicités par l'intérêt public, il existe un antagonisme évidents, naturel entre les compagnies et le public. Cet antagonisme existe aujourd'hui, c'est lui qui motive les réclamations incessantes dont les tribunes des chambres, les enquêtes, la presse, les chambres de commerce, les conseils généraux, les associations industrielles sont l'écho. Je suis bien dans la question; la preuve évidente qu'il n'existe pas dans la solidarité c'est qu'il y'a antagonisme.

"Il est ailleurs digne de remarque que les abaissements de tarifs non realisés par les compagnies contre le veceu public sont précisément les abaissements les plus utiles, car plus un abaissement de tarif est important, plus il est favorable au public, mais plus, aussi est longue la période de sacrifices que l'exportant doit traverser.

"Lorsque l'antagonisme existe entre des compagnies monopoles et la population, comment admettre que ces compagnies soient appélées à résondre les questions d'intérêts public auxquelles elles son liées?"

I have recently received important illustrations of the commercial doctrine I have stated in respect to the ascending ratios of consumption with reduced ratios of charges, derived from observations made in France by M. Dupuit, engineer of the ponts et chaussées, and a writer on political economy; and they are set forth in a paper he has written on tolls and on prices, applicable to the administration of railways. Starting from the point where a road is free from toll, he shows that as the toll is increased from a certain point the net receipts from it increase, after which they diminish and are extinguished, whilst the uses of the

* Proportion per cent. of net receipts, less interest on preference shares and on loans, to the ordinary share capital; but other returns give it as 3·12.

† Out of 405 cases of so-called accidents, inquired into from 1853 to 1857, only 43, or 1 out of 10, was reported upon as arising apparently from causes beyond control. The great bulk of accidents were reported to arise, not from the neglect of the inferior officers, but from the insufficient regulations, or want of discipline, or parsimony of the directors and superior officers.

‡ Proportions per cent. of net receipts to the total capital expended, but Mr. Locke, the railway engineer, who has had much experience on railways, gives the result, it is understood, of railways in an equivalent state of developed traffic to those of England at 9 per cent.

§ In Prussia and the rest of Germany the proportion of passengers is, of the 1st class, 1·7 per cent.; 2nd class, 23 per cent.; 3rd class, 75·3 per cent. In England it is, 1st class, 13·5 per cent.; 2nd class, 31·6 per cent.; 3rd class, 54·9 per cent. "But it is to be recollected," says Captain Douglas Galton, "that in Germany the 2nd class is as comfortable as our 1st class." The same may be said of most of the continental 2nd class carriages.

‖ The average cost of coke per mile travelled is, in Germany 2*s.* 8*d.*; in England it is 2*s.* 9*d.*

Mr. E. Chadwick, C.B.

10 May 1866.

road to the public are from the first obstructed and diminished in another and larger ratio than the receipts. This is displayed in the following table; supposing the tariff of a railway (or it may be of a canal, or a bridge, or a tax, or a price) allows a given amount of traffic which is accompanied by a corresponding ratio of receipts:—

Toll or Fares.	Traffic.	Receipts.
0	100	0
1	80	80
2	63	126
3	50	150
4	41	164
5	33	165
6	26	156
7	20	140
8	14	112
9	9	81
10	6	60
11	3	33
12	0	0

In common conditions the divergence of the ratios of receipts of traffic have been much greater, but this table will serve to illustrate the fallacy of the common assertion of the identity of the interests of the private speculators with those of the public in traffic charges. The divergence of those interests is displayed by the comparison of the column of traffic with that of the column of receipts. If the railway is in the hands of a trading company it is evidently not their interest to augment the tolls beyond a given amount. But they have no such interest as the public have to lower them beyond that amount. The Government may be content with five per cent., whilst the trading company may require ten. To get the maximum of receipts the company may put their traffic at five, in which case use of the road will be confined to 33, whilst the Government may be content to put the toll at two on the scale, in which case the traffic on the use of the road will be extended or maintained at 63. The Government, M. Dupuit observes, would thus render the road useful to twice the number of persons; but under the rule in the interests of the company, it would be as if the bridge, or canal, or railway did not exist, so for as concerns those 30 passengers, travellers, or tons of goods. The proofs are numerous that in general the trading companies which have possession of public lines of communication are not to be moved by a small benefit to themselves to do a large one to the public. Such examples as those I have cited of three and four fold uses of what should be public ways recklessly sacrificed, where the trouble to them is small if the gain to themselves be not great, or the instance cited of the ruthless exclusion of thousands from social intercourse, as well as from commerce, is by no means complimentary to the state of public information and spirit, where it is permitted to be done without question or remonstrance.

M. Dupuit concurs in the conclusion, which is now the preponderant one amongst the economists of France, and gives these illustrations in support of it, that the French themselves have been in error in permitting the Government to divest itself of responsibility, even as far as it has done in giving up the means of communication to trading companies. It is held there that experience shows that the railways are, and must practically be, a monopoly, and that that monopoly ought to be responsibly devoted solely in the interests of the public. M. Dupuit points out that the French Government, dimly forseeing the danger of the abuse of the monopolies of the means of communication, in the interest of private enterprise endeavoured to protect the public by fixing tariffs for goods; but in doing so it appears to have committed the error—into which we have fallen in England—of permitting tariffs to be fixed by railway companies on estimates of *values*, that is to say, allowing them to make exactions on *necessities*, as I term them, instead of charges on the principles of payment for *services*. Thus, the tariff in France was so fixed:—

Manure, sand, and gravel should pay	0·010
Oil	0·048
Iron	0·060
Corn	0·067
Wine	0·081
Flour	0·087
Cloth	0·080

Now, he asks, what would be the case of a private carrier who said, "I will only ask 10 to carry sand, but I will "ask 48 for oil and 87 for flour." If he could carry sand remuneratively at 10, his profits would of course be enormous if he could get 87 for carrying flour. Private competition would, however, soon reduce his price; but tariffs so fixed by an irresponsible trading monopoly commonly amount to pernicious protective duties or sumptuary taxes.

If the examples of the increase of traffic upon the reduction of fares under competition in England be duly consulted, it appears to me that they show that when the reductions are prompt as well as large the public quickly respond to them, and that the period for the growth of traffic will not be so long or the risks of loss from the change so great as is anticipated. Of course, however, in a country with a population so ignorant, so poor, so slow as the Irish witnesses describe the Irish peasants and farmers to be, the response to the advantages of reduced fares will not be expected to be so quick as in a manufacturing district in England or Scotland. I apprehend the slowness of Ireland is overstated; but I believe that the rapidity of reproduction of goods traffic, as well to some extent of parcel traffic, would be quickened and augmented to a very material extent by cheap postal telegraph, say sixpenny messages, as well as by a cheap parcel post. Labourers would be collected and farming operations speeded in harvest time and on other occasions. The goods traffic would very speedily be augmented by cheap parcel postal delivery.

Mons. Margfoy goes on to say, "L'opinion publique en "France accueillerait avec une grande faveur la nouvelle "que les tarifs de voyageurs seront desormais réduits de "moitié, que les tarifs des matières premières de l'indus-"trie seront desormais compris entre 1 et 3 centimes." He says, "Que l'Etats, de son côté, ne dise pas: Laissons "faire des compagnies, ne nous mêlons pas trop de leurs "affaires, elles onts de grands intérêts à servir, de grands "charges à supporter, de grandes obligations à remplir; "ne les genons pas dans leur action, évitons leurs plaintes, "degageons notre responsabilité. Avec de semblables "idées il n'est pas de progrès possible; les réformes les "plus utiles sont étouffées en germe et les malaises, les "souffrances qui commandents ces réformes se perpetu-"ents."

Prejudicial operation of trading interests as against the public interests.

I might give further citations to show that the course of further progress, there as here, is to get rid of the misapplication of the commercial element and trading administration, to make free the means of transit.

I may add that in Switzerland, as well as in Belgium, public opinion is running in the same direction to the principle which I have advocated of reducing the cost of transit to the actual cost of a good and responsible public service. Statistical and social science congresses, persons in the interests of trading companies, of what parties interested praise as "private enterprise," have made attacks on the Government management. This was done at the congress of Amsterdam and also at that of Berne. But these views were repudiated by intelligent and impartial audiences, and at the Social Science Congress at Sheffield also, an amount of public interference and of increased Government control for the public protection was insisted upon almost, I may say unanimously on the part of the disinterested audience, that practically would supersede the trading directories by the Government. Even in the United States public is proceeding in the same direction, and reclamations are being made for the resumption of the States or public rights over railways as over the public highways. In the Senate a committee has recommended the resumption of the public rights over the means of communication by telegraph; they have reported that a public telegraph should be connected with the posts; and the separate trading telegraphic companies will, I apprehend, have to be bought up.

Tendency of public opinion abroad.

My observations as to cheap parcel transit in England, and its vast importance in cheapening the retail distribution and developing agricultural traffic is corroborated not only by information from Switzerland as to the progress there, but as to the progress of improvement in cheap goods transit made in France. I once made what I call an economical analysis of the cost of the four pound loaf and the various elements which made up the price to the consumer; I found that while the rent in the four pound loaf was about three farthings, the cost of retail distribution was more than three halfpence; the cost of the retail distribution of meat as well as of other products was in like proportion. In manufactured products the cost of retail distribution is upwards of 30 per 100. I have explained how this cost may be reduced. In corroboration of what I have stated, and especially in the reduction of the expenses of intermediate agencies for distribution, I beg to submit the following extract from a paper lately read by M. Legoyt, the eminent chef de la division de la statistique générale de France, who was selected by the Government of France as its representative at the statistical congress in England.

Excessive cost of retail distribution.

"Cest peut-être sur l'agriculture qu'elle exerce le plus directement sa fécondante influence. Avant l'ère des chemins de fer, une foule de produits devaient être consommés sur place ou ne trouvaient de débouchés que dans un faible rayon, d'une part par le fait de leur poids, de leur volume,

Effects on agriculture.

de l'autre par les dangers d'altération rapide auxquels ils étaient exposés. Les fruits, le laitage, et autres produits de la ferme, se vendaient à vil prix faute de consommateurs. Aujourd'hui le commerce n'attend même pas qu'ils arrivent sur le marché ; il va les chercher jusque chez le cultivateur et les transporte, à tiré d'ailes, dans les centres de population, c'est-à-dire la où ils trouveront le prix le plus élevé. Le blé lui-même n'a plus pour unique débouché le marché le plus voisin. La spéculation s'en empare à ce point, que les plus forts achats ne se font plus sur ce marché, mais dans le grenier même du producteur. Cette concurrence des acheteurs, ce transport rapide et à bas prix des blés, n'ont pas seulement pour effet d'élever la rente de la terre ; ils ont une conséquence d'intérêt général bien plus considérable : ils conduisent au nivellement des prix, c'est-à-dire qu'ils permettent d'approvisionner en quelques jours, en quelques heures, les régions en déficit avec les produits des régions en excédant. De là, l'impossibilité du retour des prix de famine qui ont décimé les populations Européennes en 1811, 1817, et 1847. Qu'on se rappelle les moyens de transports extraordinaires, et cependant d'une si regrettable lenteur, qu'en 1847 le Gouvernement dut mettre à la disposition du commerce pour faciliter l'arrivée par le Rhône des blés d'Odessa, qu'immobilisaient à Marseille l'insuffisance du matériel et les prétentions exorbitantes de la batellerie, et l'on se fera une juste idée de la grandeur des services que la voie de fer peut rendre en temps de chérté ! Elle a encore cet avantage signalé pour le producteur et le consommateur que, nivelant les distances en même temps que les prix, elle peut, sous un régime de droits différentiels habilement conçu, faire profiter les régions agricoles les plus éloignées du débouché des grandes agglomérations urbaines. C'est ainsi, pour citer un exemple, qu'en cas de besoin, elle peut amener à Paris les blés de la Mer Noire au même prix que les blés de la Normandie. Il en résulte que le rayon d'approvisionnemene des grandes villes, et particulièrement des capitales, limité autrefois à un certain nombre de localites contiguës, s'étend aujourd'hui sur le pays tout entier. Ce fait économique si remarquable en a déterminé un second, qui doit exercer l'influence la plus positive sur les progrès de l'agriculture. Les fermiers riches et intelligents, qui recherchaient de préférence les domaines situés dans le voisinage des cités populeuses, pour éviter les frais de transports et profiter de la concurrence des consommateurs, assurés de trouver les mêmes avantages à des distances même considérables, s'éloignent volontiers maintenant pour aller porter sur des points plus éloignés, là où le bas prix relatif du loyer de la terre leur ouvre des perspectives de bénéfices considérables, leur capitaux et leur expérience. Nous avons constaté ce fait en France, et il se produit probablement ailleurs. Il faut mentionner encore que, grâce au chemin de fer, ce n'est plus seulement le commerce que va chercher sur les lieux les produits agricoles. Le consommateur lui-même, s'exonérant du lourd tribut exigé par les intermédiaires, s'y rend aussi et entretient avec le producteur des relations également fructueuses pour tous les deux. Le chemin de fer concourt encore au progrès de notre agriculture en lui portant, au prix le plus réduit possible, les amendements, les engrais, les matériaux de construction, et les machines. Et c'est le cas de rappeler qu'au fur et à mesure que les réseaux se complètent et pénètrent plus profondément dans les campagnes, celles-ci voient s'ouvrir pour elles des sources de richesses jusque-là ignoreés ou inexploitées faute de moyens de transport marnières, dépôts calcaires, engrais marine, forêts, carrières, minières, donnent des produits qui, sans valeur autrefois parcequ'ils étaient sans emploi, sont vivement recherchés aujourd'hui. C'est encore au chemin de fer, aux débouchés nouveaux qu'il ouvre, qu'il faut attribuer le caractère de plus en plus industriels que prend l'agriculture. Les distilleries, les féculeries, les amidonneries qui s'installent rapidement dans nos fermes du Nord, par exemple, sont bien véritablement son œuvre. Ce n'est pas tout : la facilité et le bon marché des communications permettent au cultivateur des régions les plus éloignées de se rendre à ces fêtes solennelles du travail agricole que les gouvernements ou les sociétés spéciales ont eu l'heureuse idée d'instituer sous le nom d'Expositions, d'y puiser d'utiles renseignements sur les qualités des diverses races d'animaux domestiques, sur les mérites des machines qui y figurent ; au besoin, d'y acheter les sujets les plus distingués de ces races et les meilleures de ces machines. Plus tard, excité par les récompenses qu'il a vu distribuer aux lauréats de ces fructueux concours, il viendra en prendre sa part. Enfin, ne voyons-nous pas, depuis que le chemin de fer a supprimé en quelque sorte les distances entre les villes et les campagnes, les propriétaires visiter plus souvent leur terres, en contrôler l'exploitation, s'encharger quelque fois eux-mêmes, au grand profit de leur santé, de leur fortune et des intérêts généraux de l'agriculture ?

luction of changes of ermediate ncy.

" Les conséquences de ces améliorations de toute nature se sont d'ailleurs clairement manifestées sous la forme d'une plus value considérable du sol dans un rayon des chemins de fer qu'on peut déjà évaluer à 25 kilom. au moins, et qui s'élargit chaque jour par suite de l'extension rapide des voies de communication ordinaire dont ils sont les aboutissants. Elles se sont encore manifestées sous la forme d'un accroissement très-sensible et enquel que sorte continu de la situation matérielle des populations rurales.

" Quelques-unes des observations qui précèdent s'appliquent à l'industrie et au commerce. Les produits arrivant plus tôt, meilleur état, à meilleur marché, en plus grand nombre, trouvent évidemment un plus vaste débouché. D'un autre côté, les économies réalisées sur l'achat de ces produits permettent au consommateur de s'en procurer d'autres jusque-là inabordables pour lui ; de là, un plus grand essor donné à la production sous toutes ses formes. Ce n'est pas seulement le bon marché du transport qui amène la diminution des prix, c'est encore la suppression de l'intérêt que le produit devait rapporter au fabriquant dans l'intervalle souvent considérable qui séparait autrefois l'expédition de l'arrivée ; c'est la suppression de la prime d'assurance que devait également payer le consommateur, cette prime disparaissant depuis que les risques du transport sont à la charge des chemins de fer.

" Un calcul ingénieux, fait en vue des chemins de fer Allemands, mais qui est d'une application générale, met en relief, sous une forme intéressante, l'influence du prix des transports sur la valeur des produits, en indiquant la distance que doivent parcourir aujourd'hui certaines marchandises, sur la voie de terre et sur la voie de fer, pour doubler de valeur :—

	Voie de Terre.	Voie de Fer.
	Kil.	Kil.
Or - - -	960,000	33,750,000
Argent - -	642,750	2,250,009
Laine - -	5,145	18,000
Fer - - -	386	1,350
Blé - - -	577	2,025
Houille - -	32	112

" Dans le domaine des faits industriels et commerciaux, la voie ferrée entraîne d'autres conséquences, qui n'ont guère commencé à se dessiner que dans ces dernières années. La première et la plus importante, c'est la concentration dans quelques grandes villes, et là, entre les mains d'un petit nombre de grandes maisons, du commerce d'une foule d'objets d'utilité usuelle. C'est ainsi que par suite des nouveaux moyens de communications et de facilités postales particulières quelques établissemens de nos centres industriels ou commerciants envoient aux points les plus reculés du territoire des échantillons d'abord, puis les objets demandés à des prix et dans des conditions de choix et de qualité que l'acheteur ne pourrait trouver sur les lieux. Il en résulte que le commerce de la province voit chaque jour diminuer, au moins sa clientèle urbaine. La suppression graduelle des intermédiaires par les fabricants, qui établissent des dépôts de leurs produits dans les centres de population, et les gèrent eux-mêmes, est encore un fait économique dû aux chemins-de-fer, dont l'effet général est de rapprocher chaque jour davantage le producteur du consommateur. Enfin, ils favorisent le développement de l'industrie et du commerce par le transport plus rapide non seulement des marchandises, mais encore des correspondances."

With such experience we may readily conceive that the principles for the improved development of the resources of France will prevail, and lead to further reductions of the cost of transit, which is now being called for there.

These results, however, can only be obtained, as I apprehend, under complete unity of management. With us the time lost in ascertaining the cost of transit is of itself an obstruction for the distribution of large as well as small parcels, it operates in various other ways as a serious obstruction.

Time wasted in the labour verification.

One great disadvantage arising from the present disunity of railway management in England is the great "labour of verification," as economists term it, the labour of making inquiries as to the rates of charges on goods, as well of goods in bulk as on small parcels. The saving of "the labour of verification," of the labour of finding out the rates of charges on letters for different distances, and the labour of officers in taxing them was a great administrative improvement in the principle of our letter post system. On some points the actual cost of the conveyance of letters will doubtless be much beyond the uniform rate of payment, but it was wisely decided not to be worth while on their account to dispense with the economy of time to all the writers and all the officers. In illustration of the state of things in respect to heavy goods traffic, I may mention that when I

Mr. E. Chadwick, C.B.

10 May 1866.

was last in Lancashire Mr. Thomas Wrigley, the extensive manufacturer of paper, told me that he had from time to time offers of rags made to him from distant parts of the country. The eligibility of the purchase often depended on the cost of transit. He might learn readily from the nearest railway to his works at Bury what the charge was; but the railway officer there had to make inquiries from other lines what their charges were, and it generally took a fortnight before he could get his answer. Now in respect to the transit of small parcels, I am informed that this uncertainty of charge leads to extensive malversation at the expense of the shareholders as well as of the public. My informant was a person who has served as a policeman on one large line. The information arose upon my inquiry as to the grounds of the inference arising from officers living beyond their ostensible means. This he told me was frequently the case with the parcel porters and the parcel clerks, chiefly at the intermediate railway stations. On asking him how this was accounted for he stated that it was from the practice of making frequent overcharges on small goods parcels. The way in which it was done was this: A parcel was to be sent to a distant place, generally over one or more "foreign railways." The adjacent line of railway, as belonging to another company, is called a foreign railway. The real charge might be eighteenpence, but the receiver would say he believed it was half-a-crown, which he received, and he paid eighteenpence to the company. If any question arose the amount would not be recollected, or it would be treated as a mistake. Then again the companies frequently returned empties gratis, but the porters took small payments for them. These practices were not so frequent at the head stations, where there was much supervision, as at the intermediate stations, where it was slight. His belief, as a policeman, was that the malpractice was very extensive, and the amount of money taken was, in the aggregate, very considerable, and it was reported to be prevalent to a greater or less extent on all the lines. When detections did occur the delinquents were commonly "let off" with dismissals, the companies being averse to prosecutions, and the intervention of directors, who were patrons, being frequently used for the lenient course of dismissal, in support of which there was the expense of prosecution to be incurred by the company.

Is usually engendered by obscurity and confusion and bad business arrangements.

I mentioned this information to an active director of another large line of railway, who told me that there could be no doubt of the extensive prevalence of the practice, and that it was denoted by the frequent excess of incomes beyond ostensible means, but that in the existing state of things he thought prevention extremely difficult. Now I beg to be clearly understood that these surmises from the excesses of expenditures above incomes have been in no case my own, but have been those of directors or of officers in inside positions of observation. It has been their conclusion, not mine, that I have stated. It appears to me to be a topic of special and very important inquiry. I must, however, state from my experience as a commissioner of police inquiry, as also in an inquiry into various local and other branches of administration, that it must be put down as a general conclusion that, given the opportunities for maladministration and peculation, opportunities afforded by tax regulations, you may be sure that in due time the peculation will be found to be in extensive operation, especially in relation to transactions which are small and numerous and obscure, and of a character to escape constant check and observation. In poor law administration it was noted that the officers who had the dispensation of small doles of money as out-door relief to casuals or others generally got well-to-do. I was assured on reliable grounds that the peculation of small fares by omnibus conductors and drivers of the London General Omnibus Company, as denoted by their excess of expenditure beyond their income, amounted to another dividend, or 30,000*l.* or 40,000*l.* per annum. As respects the peculation in the superior administration, the informants would themselves probably admit large exceptions and qualifications in individual instances to the presumption of the excess of expenditure beyond ostensible means; but as a rule, not confidence but suspicion is the basis of sound administration as well as of sound legislation. On this particular topic of charges for small parcels transit preventive measure would, as it appears to me, only be attained through unity of administration, that is uniform charges for goods transit as a service, and uniform publication of those charges, as are the postal charges from one end of the country to the other. I entertain the confident belief on principle that the augmentation of traffic, especially that of small goods, as I know of it in Switzerland, the saving of time in getting information, and the saving from the prevention of malversation, would be a source of great gain from unity of management, in addition to the gains derivable from the consolidation of establishment charges and economies of rolling stock.

There is another source of gain from consolidation derivable from unity of management and amalgamation with the tenfold receiving and delivering agencies of the postal establishments. In London or the chief provincial towns, if you seek to send a parcel or a telegraphic message, you have commonly the labour of sending your servants or of going yourself to find out which of several competing establishments will be the best to send it by, and at what charge. The distance of the comparatively few separate establishments is also a source of loss of time, that is to say, of additional expense. On the principle I proposed, on the experience of Switzerland and Belgium, of unity of the public service, you have the one postal establishment close to you, and the one charge always known and accessible, and the principle of uniformity would be as applicable for the cheap parcel distribution and the cheap postal telegraphy as it now is for the letter distribution, with the like great results. Belgium and Switzerland comprise poorer and slower populations than those of Great Britain, and yet the experience there is applicable to this country. In both countries it is to be observed that, low as are the fares and rates, there is a popular agitation from perception of their benefits to make them still lower.

I believe that it is only by local inquiry in the chief manufacturing and commercial cities, such as Manchester, Liverpool, Sheffield, Birmingham, Glasgow, Bristol, as to the obstructions to intercommunication occasioned by disunity of management and of service, as compared with the progress amongst the poorer and slower people, where the principles to which I have referred are prevalent; that the public wants and wishes, and the means of meeting them, can be fully ascertained, and that the proper objects of the commission can be fairly or duly accomplished.

Local i needed.

I omitted to mention as one important topic of inquiry which can only be efficiently made locally as to the real results of the reductions of fares made on competitions. At present the information appears to me one-sided and very imperfect, yet most important for the question of the probable results of a general reduction of fares. In some important instances they declared that the result of very considerable reductions was the replacement in time of the original income, but a competent inquiry has as yet to be made as to what might be the results under unity of management of the two competing lines? What would be the economy derivable from the concentration of the through traffic on, say, one line with full instead of half empty trains, and so with goods, it would probably turn out that instead of mere equality of pecuniary returns as compared with old fares, an immediate or earlier gain would have been derived. But it is matter also for local inquiry from traders, manufacturers, and others, what improved business was in course of development and was checked by a return to the old fares. In respect to the reduction of fares by excursion trains, it appears to me to be an omitted subject of a special inquiry in what proportion they are habitually used simply by excursionists, and what proportion by families or others, or persons in business who are induced by the low fares to use the occasion.

Inquiry the res compet needed.

The excessive crowding of these excursion trains obviously frustrates much of the objects of the poor excursionist, and they are attended with considerable inconvenience as well as danger, and on many accounts it would be desirable to be an object of an improved railway administration to diminish their frequency, or relieve their excesses and overcrowding, by making, in fact, every day, by reduced fares and excursion day for families and individuals.

A further topic which may be commended as one for special local inquiry by assistant commissioner is that of the increased value imparted to land or houses by the railway as a justification of rating. At present the data are very wide and various. In the instance of surburban lands the rise in value has been enormous. On the Richmond line the average value of the land at the time of its formation was about 350*l.* per acre; it is now I believe from 800*l.* to 1,000*l.* per acre, an increase not entirely, but mainly, due to the formation of railways and cheapening of transit. I myself bought a piece of land intending to build upon it, but was prevented doing so. I was told, however, not to sell it again, as it would "pay for keeping," and it has done so. I have sold a little more than half at the price I gave for the whole, and I am told that the other half will yet pay for further "keeping," as the railway may come still closer. Now if no contracting company are obliging enough to augment the value of my land, it would certainly be to my interest to pay for doing so by a rate; and I suppose other owners would certainly do so if the projects were brought before them on public grounds in the manner I proposed. But such being the gain to me by improved communication

Inquiry into the creased imparte land by proved of trans

at high fares for the past, I should gain still further by doubling or trebling the means of communication at half or one-third the fares, and it would be to my interest to pay a rate if it were needed for the purpose. In fact, I apprehend it will be found on fair and close examination that the gain for the future obtainable under complete unity of management will be quite equivalent to whatsoever has been gained by railway communication for the past.

e practical stion for nge.

Considering, however, all the past expenditure however incurred on railways as wiped off, and the question being one only for the future, I think it would be well worth my while to pay, say, 1*d.* addition to my income tax, if it were necessary, which I do not think it is, to obtain reformed general rates, and it would be well worth while to pay for future and special branch extension of the lines by local rates on the adjacent lands or houses benefited.

From some estimates which I made from analysis on the cost of agricultural produce, or meat and bread, I found that the *rent* contained in those commodities was, as a rule, about half the price of the distribution to the consumer; that whilst the rent in a 4lb. loaf, for example, was three farthings, the cost of distribution was more than three halfpence; that, in fact, the cost of the distribution of the *produce* of the land was double the *rental* of the land, and that half the cost of distribution might be saved. A complete railway reform as I propose it would, for the reasons I have stated, and from the facts of such experience I have cited from France, contribute to this end more powerfully than is yet commonly conceived. I concur in the expression of a policy by my noble friend Earl Fortescue: "Now that we have got "free trade pretty nearly as far as we can reasonably ex- "pect to get it, by the extensive abolition and reduction of "export and import duties, the next thing we must seek "is free transport, since an unduly heavy transport tax, "though paid to companies instead of to Government, is "none the less oppressive and restrictive upon that ac- "count, whether levied on persons or on goods."

fference with r. Galt.

Agreeing with Mr. Galt on some main points, my own views of the principle applicable to the question are distinct from his views, as also to the most eligible method of carrying out the reform. I attach more importance to the facilities for future extension and the completion of the capillaries of the system. I consider, moreover, that the amalgamation with the postal service and the use of the postal service for the cheap distribution of parcels and for the cheap conveyance of telegraphic messages as highly important for the attainment of complete and early pecuniary success. I wish distinctly to be understood that I cannot agree with Mr. Galt, that the existing directories or any selection by them are the most eligible parties for the purpose. I believe that if the votes of permanent railway officers were taken on the subject, that most of them would agree with me upon that point.

bjections to ilway di- ctorates for rrying out ilway reform.

By whomsoever the reform is conducted, it should be conducted by persons giving undivided attention to it. Divided attention, whether by a changing party political chief, or by any commercial director, however able, would be detrimental to the proper organization or working of any system. But by whomsoever it is conducted it should be conducted by persons who have given evidence of having obtained a complete mastery of the leading principles to be applied, evidence not merely assentient to the short enunciation of each principle, but of a mastery over it by the laborious process of observation of the particular facts of which the principle is made up. "To him who devises let "the execution be given," is an administrative action of primary importance for success. The Government may be advised to call for plans and estimates from those who would offer to conduct the measure. The railway directorates comprise men of the highest honour, intelligence, and ability in the country, but the competency of the common directorates may be challenged not only from their want of perception of any leading principle, but from their being imbued with principles which in their action are proved to have been false, not alone politically or administratively false, but false as commercial principles. And first and foremost of these is the principle of competition on which they have induced shareholders to commit their property, that is to say, the principle of unlimited competition by two or three capitals and two or three sets of railways in a field of service that may be supplied under proper regulations by one, or what I have elsewhere shown as the false principle of competition *within* the field as opposed to the true economical principle of competition *for* the field. Added to this is their ignorance of the economical and commercial principles of increasing ratios of demand with diminishing charges, with increasing conveniences and comforts of supply, with the increasing means of reducing cost by the distribution of establishment charges, with increasing uses of them, as manifested by their action on the erroneous principle that no one travels who is not obliged, and consequently that every reduction of fares, every expenditure for improvements in construction or comfort is an unnecessary expense and waste; by their discouragement and barbarous treatment of third-class passengers, really the most paying; by the refusal of covered carriages for them, by the declaration made by the directors whilst they were charging a penny a mile for carrying the old, the feeble, and the sick, penned together, sometimes standing in open carriages in the most inclement weather, that if they were compelled to give them close carriages it would be ruinous to them. Added to these is their false economical notion that the only test of the value of the means of public transit is by the payment of a dividend and not even bare payment of expenses by a toll, and that the improved value of adjacent land is an element of no practical value to be taken into account, that the cost of outlay, instead of the extent of consumption and the productiveness of the return, is the main elements for rates of charge. These and the other like current doctrines, and the new heretical one devised in their interests, that the means of communication may be abandoned for their trading profit, I apprehend imply states of mind as hopeless for devising or executing measures of railway reform as were those which had to be contended against and which so long delayed the great postal reform, that no one wrote a letter who was not obliged, and that all reductions of rates or expenditure for improvements in speed was simple and hopeless waste of revenue.

'heir false rinciples of ction.

The whole action of the railway directories as a class has been one of gigantic failure, having promised ten per cent. to original shareholders, they have given little more than three, so that the shareholders generally would have been better if they had kept the money in their pockets or in the securities of the Government. No Government in our times could have survived.

But the great and primary object is acknowledged to be a general amalgamation, and a general amalgamation cannot be effected consistently with the commercial conditions of competition on which they have taken their lines, nor can local and general taxes be consistently remitted or the benefit of public security be given for the advantages of mere trading monopolies, even if the directorates were to renounce the commercial and accept the public conditions of a responsible service. Their amalgamations have generally been commercial failures, the new branches, which on correct principles might have been and would have been really *feeders* of the trunk lines, have in their hands and by their mismanagement generally been made *suckers*. On impartial consideration it will appear they have no general basis of past good management to offer any proper guarantee for future reform, and especially for the first requisite step, that of general amalgamation, and the completion of a system of capillaries into one system, connected with an organized system of trunk lines.

For what I have stated as to the commercial mismanagement of our railways I have high commercial authority. The late Mr. James Morrison, who made between three and four millions of money, will be acknowledged to be a foremost one. He explained to me the principles of his success, one of which was always to consult the interests of the consumer. On asking him how it was that with such apparently very simple principles he was so singular in their application or that he had not numerous successful competitors, he said that the fact was that with the common commercial and trading minds it was rare to find any one who could act constantly on principle. In illustration of this fact the whole of the common railway management appears to me to be illustrative of his statement, in the want of proper consideration of the interests of the consumer, the public, and especially of the most numerous, the poorer and most important classes of them. Another illustration is presented as to their want of knowledge of the facts, as I assume it to be, by the persistent representations of the railway directories that they were largely losing money by book parcels post, by the statement that the loss was 55,000*l.* a year to the London and North-western alone, making it out that the total loss throughout the whole kingdom must be upwards of a million per annum, whilst the real fact was that the total receipts for the post office was little more than 1,600*l.*; and also their persistent representation that the success of the penny postage was due to the railways, whilst it has the greatest success in the metropolitan and other districts with which the railways could have nothing to do (*vide* Report on Parcel Post, which I herewith submit). The late Mr. Robert Stephenson is stated to have concurred with the best authorities on railway interests, and the term includes the interest of the public as well as of the shareholders, in unanimously avowing the inefficiency of railway management by directorates elected from the shareholders. His opinion of the qualities

Administrative qualities desirable for superior control.

desirable for a superior control was stated in the following well-weighed words in his augural address as President of the Institute of Civil Engineers:

"What," he said, "we ask is knowledge. Give us a tribunal competent to form a sound opinion. Commit to that tribunal, with any restrictions you think necessary, the whole of the great questions pertaining to our system. Let it protect private interests apart from railways; let it judge of the desirability of all initiatory measures, of all proposals for purchase, amalgamations, or other railway arrangements; delegate to it the power of enforcing such regulations and restrictions as may be thought needful to secure the rights of private persons or of the public; devolve on it the duty of consolidating, if possible, the railway laws, and making such amendments thereon as the public interests and the property now depending on it may require; give it full delegated authority over us in any way you please, all that we ask is that it shall be a tribunal that is impartial and that is thoroughly informed, and if impartiality and intelligence are secured we do not fear the results."

This view is in accordance with mine, and I think opposed to that of Mr. Galt.

Objections to reform on the score of Government patronage answered.

In respect to the objection made to the resumption of the public rights of the highway by a Government department, that the control would be subject to political influences, it might be answered that such influence could scarcely be more prejudicial than the sinister interests at present known to be in operation; but my answer is that a Government that cannot be trusted to do such work is a Government that ought to be superseded. Assuming, however, that there has been ground for the imputation (and the assumption is countenanced by some questions put by a Commissioner who is a permanent officer of the War Department), I submit that the remedy would be found in arrangements which shall remove the determination on contracts from changing party political chiefs, and place them in the hands of permanent responsible officers, acting under such checks as I am informed may be found by a consultation of the practice in France in this respect. I am assured by Major-General Balfour, who has had considerable experience as an administrator in India, who has closely examined the army accounts of France, that the army arrangements there and the securities for contracts for supplies are superior to those in England, and are efficient for the public protection, either from political interference or departmental malversation. Such testimony is corroborated by the great and undeniable fact of the outcome of the army administration, namely, an army nearly double the force of ours at no greater expense. One check in my own experience in contracts' management is, in making on every occasion a very close analysis of the cost of the production of works (as also of services) and careful cross estimates. Another is, wherever practical, actual trial works carefully conducted. As a general rule, however, it is absurd where any manufactures are conducted by private enterprise on a large scale, that public departments should manufacture on a small scale, and the converse. I speak on the authority of those who have attended committees being engaged in the investigation, and I say that although the Government management, as it is, may be improvable, yet Government works have had the decided and important advantage over private manufactures. At the Institute of Civil Engineers there was an important discussion as to whether the railway companies should manufacture their own rolling stock or not; of course private manufacturers contended against the practice, but I did not think they had the advantage in facts or arguments. I have private manufacturing authority for saying that Government ought to keep up some works of its own, of the nature of constant trial works and as a check to private contracts; and so I think it would be in respect to contracts for services as well as works. On this principle, which appears to me to require a great deal of consideration, much more may be said; it might be expedient that on behalf of the public a line or branch might be taken in England as a trial work.

Securities for contract management.

Abuse of patronage by railway directors.

The objection made by the railway interest to any reform in behalf of the public, that the resumption of the public means of communication must be attended by abuse and patronage, comes, however, with an ill grace from directorates who notoriously do use a railway service as means of private and of political patronage. The recent instance of Harwich is only a common instance. The retention of that pernicious patronage is a great obstacle to the reform needed in behalf of the shareholders.

Checks to corrupt governmental patronage.

Assuming (which I do not) for a moment that the whole means of railway communication should be managed direct for the public by the Government, I must submit that we have gained in recent times a tried and efficient check to the corrupt use of the public service for party purposes in well-conducted competitive examinations. In respect to the minor dockyard appointments to dockyard apprentices and labourers, it is admitted and declared on all hands by the officers there that the test of the competitive examination is complete and most beneficial. I believe there would be no doubt, looking at the subject impartially, that the application of the like test to the mass of minor railway appointments would be attended with great economical as well as social benefit. I think it not improbable that even contractors for services consulting the dockyard experience would be quite willing to avail themselves of that public test.

Success petitive nations lower a ments.

In respect to the superior offices of control of works or of service on the French principle, to which I have adverted, such as the engineers of control, we have at last gained a test which equally excludes political patronage, at all events for admissions, namely, in the Royal Engineers, who are admitted to the Royal Woolwich Academy by open competition in the first instance, and afterwards by close competition get commissions as engineers. Whatever faults there may yet be in the subject matter and methods of competition and of study, it is quite admitted by competent and impartial persons that the result is, a body of officers who, as a class, are superior to any that have yet been provided for the public service. An eminent professor, who has had opportunities of knowing both classes, ranks the new class of competitive engineers in quality of mind with first-class men of Cambridge. Competitive examination is, I may observe, the basis of the appointment of engineers in France, and private commercial companies in France engage those officers when they can get them to direct their service or conduct their works. The higher commercial bidding for the services of these competitives is a matter of complaint with the heads of the French army, that they are constantly losing their best officers by it. I submit that it would be one advantage of the reform contemplated, that it would afford an opportunity for the appointment and promotion of privates, non-commissioned officers, and officers who have served in the army or navy, and have had the important training in army or navy discipline. Mr. Whitworth, Mr. Fairbairn, and other large mechanical engineers, have given me testimony that some of the best men on their works, not only as artizans but as watchmen and foremen, are men who have served in the army or navy.

Success petitive mination the high appoint

Employ of army sioners.

The consideration of these points will, I am satisfied, reverse entirely the objection made by railway directories and persons in their interests to reform on the score of party political patronage.

I feel very confident that trial lines might be advantageously intrusted to officers of the engineers, which appointments might have the advantage that any errors in them might be more easily rectified by changes and replacements.

Some of the continental governments have utilized their engineer force by employing it directly in the construction of railways. I believe that not less than 20,000 men and officers of the Austrian army were employed at one time in the construction of the railroad from Cracow to Lemberg; the French army have done admirable work in road construction in Algeria for extra pay, and I see no reason why, with the increasing scarcity and high price of labour, men in the ranks of the army may not be allowed to volunteer for extensions and new branch lines. Our Indian as well as other experience established the fact that occupation of soldiers in civil work in peace is the best preparation for efficiency in war. Some governments have utilized their military force by employing it in the railway service to a very great extent. This has been often done pragmatically and in a way to offend Englishmen, who, though not offended at the sight of sentinels at theatres royal, have ridiculed their appearance at railway stations, and are offended at being ordered about by men in uniform. This professional habit, however, has now disappeared, and given place to the simple economy of service, unpretentious and simple.

Utilizati military in time o peace.

Closer in needed fo practical clusions.

The closer inquiries which I have ventured to recommend, and the special inquiries on the several topics, may not be necessary to inform myself as to the *principles* applicable to the subject, but they would clearly be very important to inform others who have had less opportunity of considering them. I should deem them necessary to inform myself of direct practical *application* of those principles, especially as to the extent of the economies derivable from unity of management, and as to the means that be got from those economies for the compensation of shareholders. The shareholders themselves appear to be in such widely different categories that no reliable opinion could, as it appears to me, be expressed in respect to them without close inquiry, and much special and judicial consideration and determination. All however may be promised *something* from reform; one set in the increased value from security, others in positive increase of dividends. I think

Sharehol interests, to be pro for.

islative ults to be eved.

the shareholders generally entitled to just compensation, and all might be assured of something which they would find good reason to accept, if directly appealed to. The passing of an Act of Parliament implies that there has been the legislative sanction to the plan, which the legislators are not warranted in divesting themselves of, as they are wont to do. It implies that the duty of examining the plan has been performed, and that upon examination the promise of remuneration held out by the plan is in the opinion of the legislature so well founded as to warrant the privilege. It is contrary to the popular belief of legislative duty that no proper inquiry has been made, and that the plan is one cast forth for people to act upon solely on their own knowledge, or that there has been no examination or recognition of its soundness whatsoever, notwithstanding the vast expense incurred apparently for a *bonâ fide* sifting of the real value of the plan. It cannot be intended to be said, "We authorize the raising of this "money upon pretences that, for aught we knew or cared "to know, are utterly false and ruinous." I think the basis of the reform should be that set forth in the examples in France to which I have referred, namely, by unity of management a given amount of capital may be saved, or improved money values given by public security, and savings made of local taxes, which may be divided between the public and the shareholders, the amount of which would be a matter of close inquiries, and the division of which would be matter of judicial examination and equitable allotment. I am assured by experienced persons that the shareholders would, if left to themselves, rely more upon any properly constituted public authority than they can now do on their directorates. The permanent staffs would all be retained. As one compensation to directors from their loss of privileges, they might be allowed free passes for life all over the entire system.

Mr. E. Chadwick, C.B.

10 May 1866.

Early practical arrangement for consideration.

It might be open to consideration whether the most eligible course would not be the early constitution of a distinct department of public railway business, to exercise the functions I have described of local inquiry, for the determination of new extensions and branches, and to charge that department with the duty and power of making the closer special and local inquiries needed, and the preparation of legislative measures for the attainment of all the economies derivable from unity of management under a general responsible public control. Such a body, possessing the attributes described by Mr. Robert Stephenson, empowered to prepare measures with expository reports and the justificatory evidence, would be in a position to assure shareholders, and to deal with them directly, would have their confidence, as well as that of the public and the legislature, if it were formed upon clear and settled public principles.

Tuesday, 15th May 1866.

PRESENT:

THE RIGHT HON. THE EARL OF BELMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
SIR ROWLAND HILL, K.C.B., F.R.S.
T. B. HORSFALL, ESQ., M.P.
GEO. CARR GLYN, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., C.B., F.R.S.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

MR. DANIEL GOOCH, M.P., examined.

Mr. D. Gooch, M.P.

15 May 1866.

17,309. (*Chairman.*) I believe you are the chairman of the Great Western Railway Company?—I am.

17,310. Have you been in former times connected with other large railway companies?—I was for 27 years the locomotive engineer of the Great Western.

17,311. Is that the only railway company with which you have been at any time connected?—The only railway company.

17,312. You are conversant with the details of railway administration?—Yes.

17,313. Can you furnish any details with reference to the working expenses of trains, either for goods or passengers?—I have a return worked out for the last 12 months, showing the cost per mile run of trains, and the various expenditures that are incurred upon the Great Western Railway. Taking the last year, 1865, our maintenance of way cost us 6·35*d.* per train mile. The locomotive account was 7·65*d.*; the carriage and waggon repairs 3·37*d.*; the carrying account was 6·91*d.*

17,314. (*Mr. Glyn.*) What do you mean by the carrying account?—The carrying account embraces all the charges for the management of traffic apart from those other definite charges such as rolling stock.

17,315. Does it include the fixed charges?—Yes, it does. I think I had better give the whole first, and then explain the principal items. General charges, 2·74*d.* Compensation and allowances—that is an item for compensation to people whose goods are injured—amounts to ·45*d.*

17,316. Both for goods and passengers?—Yes, for the total mileage. I am dealing with the total. Disbursements for repairs, which has reference to the general repairs of furniture and stations, not the buildings themselves, which are included in the permanent way, come to ·13*d.* Then we come to expenses of working joint lines and stations, ·99*d.* Fire insurance premiums, ·07*d.* General office expenses, which mean allowance to directors and auditors, establishment and secretaries, general manager, and office expenses, ·62*d.* Government duty on receipts from passengers comes out at 1·12*d.*

17,317. (*Capt. Galton.*) That does not include rates?—No, that is Government duty on receipts from passengers only. Then there are miscellaneous expenses, which is only a small item, ·04*d.* Rates and taxes, 1·10*d.* Then we pay rent for hire of waggons, ·19*d.* Those are waggons which are purchased upon a system, which is a good deal adopted, of paying so much per year for a small number of years.

17,318. You keep them in repair?—Yes, we maintain them; they are our waggons. Instead of using capital, we pay so much per annum, which repays the manufacture in the course of seven or ten years, as the period may be. Then we reserve for doubtful debts, ·06*d.*

17,319. (*Mr. Horsfall.*) That is, bad debts?—Yes. We pay so much every half-year as a reserve to meet that. It is an annual charge. We make a fixed charge of 3,000*l.* a year, which we put aside for that. Then stamps for debentures, ·02*d.* Those together amount to 2*s.* 7·81*d.* That is the actual cost per train mile for the year ending 31st January 1866. The total train miles amount to 12,396,975. I will now give the details embraced in the larger items. I will first take maintenance of way. The details embraced in that are the salaries, office and general expenses, the engineers, superintendents, and inspectors; wages of men employed in repairs and renewals of permanent way, and ballasting; materials used in repairs and renewals of permanent way; repairs of bridges, tunnels, viaducts, slips, &c.; repairs of stations and buildings, signals, cranes, weighing machines, &c.; repairs to gates, fences, and approach roads. Then there is a small sum for subsidence of mines and casualties of that kind. Then there is an item for reconstruction of bridges and viaducts, which is substituting brick or iron for timber. Those are the items embraced in the maintenance of permanent way.

17,320. (*Capt. Galton.*) Then you charge to the revenue account the substitution of brick and iron for timber in bridges and viaducts?—We assume that an iron or brick viaduct is of more value than a timber one, and therefore we charge a certain portion of the cost to capital account, the balance going to revenue. Under the head of locomotive, there are the ordinary charges

Mr. D. Gooch, M.P.

15 May 1866.

for coal, coke, and firewood for engines; oil, tallow, cleaning, and sundry stores for engines; water and cost of engines for pumping; wages of enginemen and firemen, including allowances; wages of engine-cleaners, cokemen, and out-door labourers. Then there are wages for repairs and renewals of engines and tenders; materials for repairs and renewals of engines and tenders; factory expenses, including wages and materials for repairs and machinery and tools, factory buildings, proportion of management, &c. Then there are wages and materials for repairs and renewals of buildings and turntables. Then there are general charges, which include proportion of salaries of superintendents, foremen, clerks, &c.; and rates, taxes, lighting, freight of stores, &c. These are all included under the head of "locomotive."

17,321. The whole of the expenses of the engines are included under the head of locomotive?—The whole.

17,322. In getting at the mileage for engines, when you have piloting and shunting, how do you reckon them;—I am now dealing only with train mileages. The piloting and shunting are not counted in at all.

17,323. You throw the whole into the train mileage?—Yes, the cost of that is thrown upon the train mileage.

17,324. Does your account show what proportion of the 7·65*d.* is taken up by the wages of the engine-driver?—The 7·65*d.* is made up of these details:—Fuel, 1·71*d.*; wages of enginemen and firemen, 1·49*d.*; wages of cleaners, cokemen, &c., ·43*d.*; oil, tallow, and sundry running stores, ·28*d.*; wages and materials for repairs and renewals of engines and tenders, 3·24*d.*; water, including pumping engines, ·18*d.*; Salaries of superintendents, clerks, &c., ·16*d.*; gas, rates, buildings, and fire charges, ·13*d.*; those together making 7·65*d.**

17,325. The cost of 3·24*d.*, which is the cost of wages and materials for repairs and renewals of engines and tenders, is what keeps the engine up in full working order, but does not add a more powerful engine; for instance, if you have been building a more powerful engine than you have been previously running, would you charge the whole cost of that more powerful engine upon capital, or would you charge some of it to revenue and some of it to capital?—No; we have made no charge against capital for renewal of engines; any new engines that we substitute for old ones, although they may be an improved engine on the old ones, are debited to revenue account.

17,326. Then you do not adopt the same course with your engines that you do with your permanent way?—No; it is a very small item, which is absorbed in the general amount.

17,327. If you increase the number of engines you charge those to capital account?—Yes; we maintain our stock by number. Whatever number of engines we have we maintain that. If one is destroyed by age, and it is better to build a new one, we build it at the expense of revenue, of course, taking credit for the materials of the old one as far as they go.

17,328. (*Earl of Belmore.*) How long does an engine last?—The engines that we commenced with in the year 1839–40 are still running very well.

17,329. (*Chairman.*) But there is not a great deal of the old engine left?—Yes, there is a great deal left; there are the wheels, the axles, the boilers, and in fact a great deal of the old engine is left.

17,330. (*Capt. Galton.*) What is the most economical distance which you consider an engine should travel so as to keep the wages of the enginemen and firemen at a minimum per train mile?—We think 160 miles per day.

17,331. Is that for every day in the week?—No; it is rather a question of enginemen than engines; our engines will run a great deal more than our men will, therefore we endeavour to give our men one day in the week as a shed day.

17,332. Exclusive of Sundays?—He takes his turn on the Sunday in addition. There are necessarily a great many men on duty on Sunday, but we do not include Sunday in the shed days.

17,333. (*Mr. Glyn.*) Then you consider 160 miles per day a fair day's work for an engine?—That is what we endeavour to get, but we do not get it on an average.

17,334. What is the average that you do get?—We do not get much more than from 110 to 120 miles per day.

17,335. (*Capt. Galton.*) That would be taking in the shed days?—I am taking engines in steam.

17,336. Then the average would be even lower than that?—It would be even lower than that, because, if you take the shed days, we pay the enginemen wages for the shed days. It is, as I have said, more a question of enginemen than of engines. We do occasionally run engines a considerable distance. We used to run the engines of our express trains from London to Birmingham and back, and also from London to Bristol and back.

17,337. Did they do that four days a week?—No, they did not. We do not work the men on the main line on the same train every day; for instance, there may be 12 or 14 passenger trains started from Paddington; the man who goes out one morning at 6 o'clock will go out the next morning at 7 o'clock, and so on, and he will take the rota of each of the trains, so that he goes through the whole of them.

17,338. You do not put the same people on your express trains?—Not at all.

17,339. Do you pay them at all according to the distance they run?—No. We expect a man to run about 160 miles per day, and after that, when we ran the express trains as I have described to Bristol and Birmingham, we gave the men a day and a half for it, and the next day they worked half a day in the shed, so as to make up the two days.

17,340. (*Mr. Horsfall.*) Your calculation that the engine would run 160 miles a day is without any undue wear and tear?—Yes, even more than that. As far as the engines are concerned, they should run 200 miles a day. It is not a question of engine at all, it is quite a question of the fatigue we can subject our men to with safety.

17,341. (*Chairman.*) Does your train mileage include empty trains or full trains?—Empty trains as well.

17,342. (*Capt. Galton.*) The cost of the shunting is included in the train mileage?—Yes, clearly.

17,343. So that it includes the whole charge of your locomotive establishment?—The whole charge of the locomotive establishment divided by actual trains.

17,344. What wages do you pay the engine-drivers?—We have a scale. The highest class of wages under which the greater number of our old men are getting 7*s.* 6*d.* per day, and 6*d.* per day good-conduct premium, or 10*l.* per year.

17,345. What are the wages of the firemen?—The highest is 4*s.* 6*d.*

17,346. What is the lowest class of engine-drivers?—He begins as what we call a shunting man or a pilot man, at 4*s.* 6*d.*; then he goes on to the goods trains at 5*s.*

17,347. Then your highest class of engine-drivers get higher wages than are paid in any establishment where machinery is employed to artizans?—Yes, much higher.

17,348. (*Mr. Horsfall.*) What do your guards generally get?—Our guards get 21*s.* to 40*s.* a week.

17,349. (*Earl of Belmore.*) How do you manage with regard to your engine-drivers on short branches, upon which your trains run backwards and forwards several times a day?—He does his day's work; he is at it all day long.

17,350. You do not put him on the main line occasionally?—No, he is constantly on that branch—he lives there.

17,351. That is the system which you adopt?—Yes.

17,352. (*Capt. Galton.*) Can you separate goods from passengers?—No; we have never been able to

* The various amounts stated give a total of only 7·62, but the figure 7·65 is produced from the totals of cost and mileage.

get any satisfactory apportionment of the expenses, so large a portion of our staff over the line is employed in both goods and passengers.

17,353. (*Mr. Glyn.*) It is impossible to subdivide them at all the small stations ?—Quite so. It has been attempted once or twice to see if we can do so satisfactorily, but without success.

17,354. (*Capt. Galton.*) Do you separate your locomotive expenses into goods and passengers ?—Yes ; 7·65*d.* represents the average, and it may be taken that about 8½*d.* is for goods, and from 6½*d.* to 6¾*d.* for passengers.

17,355. In which of the detailed items would the excess arise on goods ? Would it arise on engine-drivers and firemen ?—Of course it arises a good deal on fuel ; the fuel is nearly double on our goods to what it is on our passengers trains.

17,356. Are the repairs more ?—The repairs are more.

17,357. (*Chairman.*) Now will you proceed with your abstract of the larger items ?—The next is as to the repairs of carriages and waggons, the items of which consist simply of materials and wages for that purpose. The carrying account is a large item. That embraces these items :—Guards, police, and inspectors, porters, clothing, stores consumed at stations by the carriages and waggons in the shape of grease ; stores, disbursements, that is, to a certain extent, managing our store department, carrying expenses, lighting and gas at stations, London receiving houses expenses, mileage, office expenses, telegraph expenses, and hydraulic working expenses in our various goods sheds where we use hydraulic power. Many of those are large items.

17,358. (*Capt. Galton.*) What are the relative wages that you pay the goods engine-drivers as compared with the passenger engine-drivers ?—The goods engine-drivers begin at 5*s.* per day, and as all new men go on to goods engines before they go upon passenger engines, the lower wages men are on goods engines and the higher wages men are on passenger engines.

17,359. (*Mr. Glyn.*) Do you include the station clerks in the salaries ?—They are not in that list, they are in the next head, which is general charges.

17,360. (*Chairman.*) If I caught your answer right, amongst one of the items in the carrying account there was one called carrying expenses ; that appears to be almost the same as the carrying account ?—It is.

17,361. How do you distinguish carrying expenses from carrying account ?—I am afraid I can hardly tell you what that means, but I will furnish it.*

17,362. (*Capt. Galton.*) You passed on from the locomotive to the carrying expenses ; in your first answer you gave repairs of carriages and waggons and locomotives ?—I mentioned just now that those consisted simply of repairs.

17,363. Can you give the difference in the cost of repairs between the passenger carriages and the goods waggons ?—3·7*d.* ; that is made up in this way ; taking the same period that I gave for repairs, the cost per train mile of our carriages was 1·46*d.* ; the cost per train mile of our goods waggons was 4·84*d.* ; then the luggage covers come to ·53*d.* Those are calculated on the mileage of the trains over the cost of the carriage repairs and the waggon repairs separately.

17,364. Are the waggon covers on the Great Western more expensive than on the narrow gauge lines ?—What I am speaking of here as luggage covers are tarpaulins. The other covers, which enclose the waggons with a piece of tarpaulin shut up like a fan, are included in wages and repairs.

17,365. Can you give any estimate of the average number of miles that are run by the passenger carriages and goods waggons in a day, or in a year ?—I took that out a few years ago for another purpose. I have got it up to the year 1862. In 1858 our total average mileage of all vehicles was 8,820 ; in 1859 it was 9,394 ; in 1860 it was 9,988 ; in 1861 it was 9,407 ; and in 1862 it was 8,304. I have not any later returns.

17,366. That is for passengers ?—That is the total.

17,367. Can you divide that between passengers and goods ?—I have no doubt I can furnish such a return, but I have not the means of dividing it with me.

17,368. (*Mr. Glyn.*) Have you got it for the narrow gauge also ?—No ; the narrow gauge was not quite so good. Speaking from recollection, I think that the mileage over the narrow-gauge system was between 7,000 and 8,000. Our narrow-gauge system embraces a great many lines upon which the traffic is exceedingly light, namely, those in the West Midland districts.

17,369. (*Chairman.*) Do you know whether there is any material difference between the miles run by the waggons and the carriages per year ?—A carriage runs further than a waggon does, a great deal further.

17,370. Can you give what useful mileage you get out of the carriages and waggons in running just as you say ; you run an engine from 110 to 160 miles per day, can you state how far the waggons and carriages run in the same way ?—I have no doubt we can get some return of that. These are useful mileages. The coal waggons run full one way, and empty another. The empty mileage is included, of course, because it cannot be called useless, as it must go back to load.

17,371. (*Capt. Galton.*) The mileage which is mentioned is, of course, in proportion to that which is standing idle and under repair, as well as over that which is running ?—In both cases it is on the whole stock.

17,372. The carrying account is the expenses of the staff employed ?—The working staff of the line.

17,373. Porters, and every one, except the station masters ?—The station masters are another item.

17,374. All the expenses of your large goods station at Paddington are included under that ?—Yes.

17,375. If you have carts and waggons to distribute traffic in London or in the country, is that included ?—No ; cartage is not put into our accounts at all, it is deducted from our receipts.

17,376. Cartage is covered by a separate payment ?—Yes ; it is not even put into our receipts or expenses.

17,377. You merely add to your receipts the actual cost of the cartage, and the overplus or profit ?—Yes.

17,378. (*Chairman.*) What do the general charges consist of ?—General charges is 2·74*d.* They consist of superintendents and clerks ; stationery account, disbursements and tickets ; sundry office expenses, printing, advertising, postage, &c. ; travelling expenses, &c. ; water at passenger stations, and medical expenses.

17,379. (*Capt. Galton.*) Do you provide medical attendance for all your servants ?—We pay a medical man a certain sum ; he attends the provident society, and also in case of any accident he goes at once to see the cases. We pay him a certain salary for it ; and of course bills come in for medical attendance in case of an accident on other parts of the line. The other items which I gave there is no general abstract of ; they speak pretty much for themselves.

17,380. (*Chairman.*) Does the item of expenses of working joint lines and stations include your proportion of all the working expenses of the joint lines ?—It is our proportion of them.

17,381. And the maintaining of them ?—Yes. It is not very large per mile, but it comes to a great deal ; the amount is over 51,000*l.* a year.

17,382. I believe the amount of the joint mileage

* Carrying account includes the wages of porters, police, guards, clothing, stores, gas, water, telegraph expenses, &c.

Carrying expenses includes horse shunting at stations and some other smaller miscellaneous charges.

Mr. D. Gooch, M.P.

15 May 1866.

which you work is very small as compared with the whole length of your line?—I can give all the mileages. Our actual mileage is this. We are working on our own account 1,175 miles. We work half the line between Gloucester and Cheltenham, which is six miles altogether; three miles belong to us, and three miles belong to the Midland, each of us maintaining half. The North-western and the Great Western work the Shrewsbury and Hereford line, which is 50 miles; the Tenbury line, which is five miles; the Shrewsbury and Wellington, which is nearly 10 miles; and the West London, which is $2\frac{1}{4}$ miles, making 34 miles of joint line that we work under those heads. Then the Great Western, the North-western, the London and Brighton, and the South-western work the West London Extension jointly; $1\frac{1}{2}$ miles of that is ours. We work the Metropolitan and Hammersmith line; say one-half, that is $1\frac{1}{2}$ miles of that belong to us. We have a total mileage which our trains work, and upon which our rails are, of 1,257 miles. We are working jointly, although the receipts are not brought into our traffic account, the Birkenhead Railway. We are working the Vale of Neath Railway. We work into Manchester over the North-western, with running powers. In fact, the total mileage over which our trains work is 1,389.

17,383. What are the other items on which you think any explanation would be useful?—I think the others speak very much for themselves.

17,384. Are those much about the same which they have been on the average for some years?—They have been slightly on the increase.

17,385. Has there been an increase on all the items generally?—No; I think that some of the locomotive items are slightly on the decrease. We have been using cheaper fuel. Our wages and repairs have been slightly on the increase, and our traffic charges have certainly been on the increase.

17,386. (*Capt. Galton.*) Is that from the rise in wages?—Partly that, and partly from our establishment getting larger.

17,387. (*Mr. Glyn.*) You find wages rising in all branches, do you not?—Yes, everywhere; it is a very serious matter.

17,388. (*Chairman.*) Is maintenance of way a stationary amount?—Maintenance of way has been stationary for some little time, but the wages are now rising and increasing it.

17,389. Have you any means of forming an opinion as to how the maintenance of way is affected by goods traffic and by passenger traffic; that is, whether on a line which has a large mineral and goods traffic the maintenance of way is heavier than on lines where the traffic chiefly consists of passenger trains?—That must, of course, be very much a matter of opinion only; but there can be no doubt that goods traffic, run as it is now run on the main line, must be much more destructive to the permanent way than passenger traffic. We are obliged to run at much higher speeds than it is prudent to run for the good of the permanent way, in order to get the line clear for the passenger traffic, and the construction of the waggons and the condition of the waggons are very much worse for the road than better constructed carriages.

17,390. I presume the goods engines are less adapted to the road than the passenger engines?—I do not know that the engines do so much more harm to the road, because a goods engine is rather better balanced than a passenger engine. Of course, the great object is to distribute the weights equally upon the wheels, so that there shall not be any greater weight upon any one pair of wheels than another. In the case of a passenger engine, they are obliged to put the whole traction power on one pair of wheels; some have four driving wheels. I think the goods engines are not more destructive to the roads than passenger engines.

17,391. (*Mr. Glyn.*) Do you not consider that a high speed for goods trains is a most expensive operation for a railway company?—I think it is. It is a great evil to us to be obliged to run our mineral traffic at the high speed we do run it at.

17,392. What do you consider to be the right average speed of goods trains?—I should like to see goods trains not exceeding 20 miles per hour, or upon the average 15 miles per hour. We are running goods trains at a speed of from 25 to 30 miles per hour, and higher than that if the engine can do it. It is a question of what the engine can do. We are obliged to run them at that speed to keep them out of the way of the other trains.

17,393. (*Chairman.*) If it were possible to run goods trains at a much slower speed, taking all the traffic that is desirable, for instance, at 15 miles per hour, would that greatly reduce the cost of the working expenses?—It would certainly reduce the cost of the working expenses. It would reduce the expense of maintaining the permanent way, and we should be able to take heavier loads. There are a great many charges on railways which are not at all affected by those questions.

17,394. (*Mr. Glyn.*) Practically it is an impossibility to reduce the speed of the goods trains, is it not?—Yes, because we are obliged to free the lines for the passenger traffic. We run the goods trains at night as much as we can, for the purpose of reducing the high speed; but even then the public require high speed for some goods.

17,395. (*Chairman.*) They require their goods to be delivered the first thing in the morning?—They do. Those who live at Bristol, who send their goods at night, require them to be delivered in London in the morning by the time that the warehouses are open; in fact, we are obliged to run express goods trains, as it were.

17,396. (*Mr. Glyn.*) The same remark applies to other places sending goods to London, such as Manchester, for instance?—Yes; goods leaving Manchester at night must be delivered in London early in the morning; they send them purposely by quick trains.

17,397. (*Capt. Galton.*) Is not that class of goods conveyed by waggons which are better adapted for running at high speed than the ordinary goods waggons?—I do not think there is any difference in the waggons. They are our own waggons, which is an advantage as compared with the mineral waggons.

17,398. I believe all your waggons have spring buffers?—Yes.

17,399. Is it the case that the bearings are not so good?—The springs are much more rigid, and the waggons are very short; the wheels are probably, as a rule, not in such good order as the wheels of the carriages are kept, and they are allowed to go longer before they are turned up.

17,400. (*Mr. Horsfall.*) Of course, when the wheels are not in such good order, the wear and tear of the line must be greater?—Yes.

17,401. Have you tried the effect of steel rails?—We have a few steel rails laid down, but not to any extent.

17,402. You have not laid down sufficient to be able to speak as to the difference in the wear?—No, we have had no experience as to the difference in the wear.

17,403. (*Mr. Glyn.*) In fact, that probably can only be ascertained after many years?—That is so.

17,404. (*Mr. Horsfall.*) We have it in evidence before us, that the difference would probably be 20 years as against 40 years, iron lasting 20 years and steel 40 years?—Iron, unfortunately, does not last anything like 20 years; I should think it would be quite in that proportion. I should think a good steel rail would last 40 years; but the difficulty with steel has hitherto been the uncertainty of it.

17,405. (*Mr. Glyn.*) What do you think is the fair duration of what they call the life of a rail?—That depends very much upon the position in which it is placed. It may require relaying in six or eight months if it is in a station, or if the traffic is large; but on many parts of our line a rail has done well for ten years. Of course, rails last much longer upon branches.

17,406. (*Sir R. Hill.*) How does the cost of steel

rails compare with that of iron rails?—They are about double.

17,407. (*Capt. Galton.*) And last twice as long?—I should think more than that. I should think if we could afford to make the outlay that it would be desirable to use steel rails, particularly if we can get steel rails more certain, but the danger of steel is that they are very brittle at times. We have had steel rails delivered to us which broke in lifting them out of the waggon; and then we incur a certain amount of risk in working them afterwards if they are so brittle as that, because we cannot tell until the breakage takes place.

17,408. If steel was largely introduced would it modify the weight of the rolling stock; would you be able to use a less weight of rolling stock with the goods you carry than you do now?—No; I do not think it would make any difference in that respect.

17,409. You could have lighter axles, I suppose?—No; I do not see how a steel rail would affect the axle.

17,410. I meant if steel axles were introduced?—It would be stronger, no doubt, but I think it would be a hazardous thing, and anything that you could save out of them would be a very small saving as compared with the gross weight of the train.

17,411. (*Chairman.*) Do you think it safe to use a lighter rail of steel than an iron rail?—I would not use a lighter rail. I would look simply to the durability of the steel rather than to the strength.

17,412. (*Earl of Belmore.*) Does the manner in which a rail is jointed together and fastened to the sleepers make any difference in the wear and tear of a good road over a bad road?—No doubt the mode of fishing the rails has improved the road very much indeed. Formerly, we used to get a jerk or a blow at every joint, but now it is more a continous bearing. As long as the surface of the rails are good the joint is as good as the rest of the rail.

17,413. Does it make all the difference whether a rail is fastened by nuts or simply bolted down by iron bolts to the sleepers?—I scarcely follow the question,

17,414. I am referring to the mode of joining the rails to the sleepers?—On the best constructed roads they are generally fastened down by bolts.

17,415. Through the flange of the rail?—You have a flat-bottomed rail in that case, and then you fasten that rail down with bolts in the same way as we fasten the Great Western rail down to our longitudinal sleepers.

17,416. Does the variation of those two modes of fastening rails make much difference in the life of the rails?—No; I do not think so. I think it is a mere question of maintenance and keeping the road firmer together.

1,7417. (*Mr. Glyn.*) I presume you would say that where the traffic is very heavy it is quite impossible that there should be any lightening of the rails on the line?—The tendency is to increase the weight of the rails.

17,418. You must have a great resistance in point of fact to the weight which passes over the rail?—You must; the vehicles of the present day are nearly double the weight they used to be.

17,419. (*Chairman.*) The rails used at the present day are very much heavier than those used when the line was opened?—Yes; we are using 80-lbs. rails where 60-lbs. rails were formerly used.

17,420. (*Capt. Galton.*) Would the figures you have given apply to the narrow gauge as well as to the broad gauge?—With reference to the average cost of trains, I think it would. You may say that the broad gauge would be a little in excess of the narrow gauge, but it is not much. Our engines are heavier on the broad gauge than on the narrow.

17,421. And the goods' trains do a great deal more work, do they not?—They do a great deal more work. Both for goods and passengers we have more powerful engines.

17,422. (*Mr. Glyn.*) Do you find that the blending together of the narrow and broad gauge has added very much to the cost of maintaining the way?—Very much. The additional expense of renewing the timber has not as yet come into the cost, because the mixed gauge has not been laid long enough to render necessary a renewal of the timber, but looking to that in addition to the present cost it will be from 80*l.* to 90*l.* per mile. Our present increase per mile on the mixed gauge as compared with the single gauge is 46*l.* per mile; if we add to that the estimate of a renewal of the timber it would bring it up to 93*l.*

17,423. How many years have you worked the mixed gauge?—I should think about 12 years on a portion of the line.

17,424. (*Chairman.*) Do you know whether railway companies keep their accounts in such a form that the items you have enumerated are nearly the same on all the different lines?—I think the bulk of them do.

17,425. Do the Board of Trade returns furnish a fair comparison between the different lines?—Yes; I should think they did.

17,426. Do you see any prospect of a material reduction in any of the working expenses being accomplished?—No; I am afraid I see a very great prospect of a considerable increase. I should think our wages at the present moment are 8 or 10 per cent. higher than they were a year ago. Wages have increased within the last five or six months to one class of men after the other from 8 to 10 per cent. That forms a large item for us. I do not think much can be saved out of the working charges.

17,427. The charge per train mile in Scotland and Ireland appear to be lower than in England, do you know how that arises?—No; I did not know that was the fact.

17,428. I believe it may be stated roughly at 2*s.* 1*d.* in Ireland and 2*s.* 2*d.* in Scotland?—No doubt wages are a very great deal lower both in Ireland and Scotland than they are in England, to begin with. Men are paid in the north of England and Scotland 24*s.* per week, when we pay 36*s.* per week, which is a very large difference. All wages are much greater in England than in either Ireland or Scotland.

17,429. Fuel would be somewhat dearer in Ireland than in England?—In Ireland it would be, and I should think in Scotland.

17,430. (*Mr. Horsfall.*) The wear and tear of the Scotch lines is not so great as upon the English?—It is very much less. They do not know what their ultimate wear and tear will be yet; their lines have been very lightly used as compared with ours. A great deal depends upon the accommodation which is given to passengers. You may make a passenger carry his own portmanteau instead of having porters to do it for him. They do not give that amount of accommodation in the northern portions of England and Scotland that we give in the southern portions of England. I did not know that there was any very large difference between them.

17,431. (*Chairman.*) I think there are many instances in which one company work a line at 1*s.* 10*d.* per mile, for another company?—Where one company contracts to work for another?

17,432. Yes?—It cannot embrace the same items. There are a great many conditions attached to working by contract; for instance, the weight of the train is very often limited.

17,433. (*Mr. Glyn.*) You cannot institute a comparison unless you know all the circumstances?—The contract must be seen to know how the difference occurs. There may be an object in working it cheaply, and the case alluded to may be done at a loss.

17,434. (*Earl of Belmore.*) I suppose it is possible that a working contract of that description might not include the repair of the permanent way?—It might not. There is no reason why it ought to be worked cheaper than the railway company could work it themselves.

17,435. (*Sir. R. Hill.*) You have given the average cost per mile of passenger trains, which appears to be nearly 2*s.* 8*d*?—Yes, I have given the average cost of passenger and goods in that.

Mr. D. Gooch, M.P.

15 May 1866.

17,436. The passenger trains are somewhat less?—The passenger trains would be less per mile than the goods.

17,437. Of course the cost of a particular train must depend on the number of carriages it contains?—Of course it depends on the number of carriages.

17,438. What would be the average number of carriages in one of your passenger trains?—I should think, taking our branches, that the whole average applying to passengers which I have given you would not be more than four to six coaches, although the maximum may be 25.

17,439. Can you say what difference it would make in the cost of a train if a carriage were added to it?—The addition of a single carriage to a train of five or six, would be the cost of that individual carriage which might be about $\frac{1}{2}d.$ per mile for that carriage. Of course there would be a proportionate increase on the road, but it would be a very minute fraction.

17,440. Would the $\frac{1}{2}d.$ cover the whole expense of the carriage repairs and so on?—The repairs of the carriage would be covered by between $\frac{1}{2}d.$ and $\frac{3}{4}d.$, according to the class of carriage.

17,441. There would be some slight addition to the cost of locomotion, would there not?—Fuel would be a little heavier. It would be difficult to estimate what the cost of one additional carriage would be as regards the locomotive. The engine would probably weigh from 30 to 40 tons, and if each of the carriages weighed five or six tons, seven carriages would be about 40 tons, so that it would be as 7 to about 80 in weight, but a much less proportion in cost.

17,442. You have not perhaps ascertained what the additional cost for locomotive would be?—No, it would be small. We have no means of getting at it.

17,443. Taking the addition of the weight of a carriage, and seeing what proportion that bore to the previous weight of the train, could that calculation be made?—Yes, you would take the carriage itself; it would be a distinct charge.

17,444. I am speaking of the locomotion?—I think it would be so small that the figure which could be put for one carriage out of six or seven would not be worth considering; it would be very small for the locomotive.

17,445. Then the expense of working a line must be very much diminished per passenger if you can run long trains containing a large number of carriages?—No doubt, that is what we wish to get. Long trains pay us best, but unfortunately for us there are too many small trains mixed up in them.

17,446. You think that the additional cost of adding a carriage is not much more than the cost of the carriage itself, that is to say $\frac{1}{2}d.$ per mile?—There must be a certain amount of increased wear upon the rails, and there would be a certain increased cost of locomotive power.

17,447. You think $1d.$ would cover the additional cost?—Yes.

17,448. If you reduced the number of carriages, that is, if you were to take off a carriage, you would reduce the cost of the train to the same extent?—Yes.

17,449. To about the same extent?—It would be pretty much in the same proportion. The engine, which is a large portion of the weight of a train, is a constant quantity, and therefore the difference in the weight of the train must be looked at in connexion with the weight of the engine also.

17,450. Roughly speaking, the additional cost arising from adding a carriage would be about $1d.$; may the saving, when you are throwing off a carriage, be taken roughly at about a $1d.$?—I think $1d.$ is too much. I should not like to say it would be $1d.$ in either case. The permanent way and the locomotive would not amount to $\frac{1}{2}d.$

17,451. (*Chairman.*) Do you see any objection to the publication of rates, that is, that all the rates charged on the line should be accessible to the public?—Do you mean the whole rates of the railway company?

17,452. That any person who wanted to send any traffic by the line should be able to ascertain what the charge would be?—I think he ought to be able to ascertain the charge, and I apprehend he is quite able now to ascertain the charge.

17,453. What are his means of ascertaining the charge?—By inquiry. Of course the rates on a railway like the Great Western are very voluminous; it is an enormous thing.

17,454. They would probably amount to some millions, would they not?—I have been making inquiry lately about some of those questions, and I have been told that the clerks have been a couple of years trying to get the rates into shape. It would take a long time to complete it. They amount to some millions of figures.

17,455. But they are all tabulated in books, are they not?—They are all arranged in books.

17,456. Is there any objection to the public having access to those books?—I do not think there would be any objection to the public having access to those books if they really wanted information, but I do not think it would be well for us to have an office where those books might be open for inspection to anybody, because a great deal of time would be needlessly occupied by our people. Anybody who wishes for information now can get it if he really requires it.

17,457. (*Mr. Horsfall.*) You would have no objection to showing the book to parties who complain of the rate being too high?—I apprehend we should not; but I am not prepared to speak positively as to what our practice would be, because that is a matter with the details of which I have not had much to do. We have no wish to conceal what the rates are from anybody, the rule being that everybody is put on the same footing for the same service.

17,458. And the same with regard to your terminal charges?—Yes, the rule and principle being that everybody is treated alike for similar services.

17,459. (*Mr. Glyn.*) Your objection would mainly be to the difficulty and inconvenience of having to deal with a vast number of rates at any particular station?—Yes, of course it would be a very large thing indeed.

17,460. An immense thing, would it not?—Yes.

17,461. (*Capt. Galton.*) Still, should you see any objection to their being kept in such a form as that they were accessible?—The rates from one particular station to another station?

17,462. Yes?—You could not have all the rates at any particular station.

17,463. I mean the rates from one particular station to another station accessible to anybody to look at if they chose?—I do not know that there would be any particular objection to that. It might be used as a nuisance to us if people from curiosity chose to spend their time in calling our clerks to attend to them. We have quite enough to do for our clerks, but as far as affording any useful information to freighters and persons sending goods upon the line, they are quite at liberty to look at the books.

17,464. (*Sir R. Hill.*) Would not that objection be met by charging a moderate fee?—Whether we should get the fee or not, I do not know.

17,465. (*Mr. Horsfall.*) Do you think the public would pay a fee for that?—I do not think they would. They think they are entitled without a fee to ask what the rate from A. to B. might be.

17,466. Do not you think that the idea of asking for a fee would cause a great deal of angry feeling?—Yes, I think it would. I think the public are entitled to every information that can be given them, and we do give it them. I have never heard any complaints that parties could not get rates if they asked for them.

17,467. (*Capt. Galton.*) Of course the only object would be to prevent any idea in the public mind that special rates were given to particular persons?—Yes, I think it would be a fallacy to suppose that if railway companies wanted to act improperly by the public, that the mere looking at our books would be any check, because we know well enough what has been done. I do not know to what extent it is done

now, but there has been such things as rebate allowances, and things of that kind, which are not in the rate book at all, and the deduction would not appear there.

17,468. (*Lord Stanley.*) I suppose the publication of rates by itself would be of very little use, and might very easily be evaded, might it not?—It could easily be evaded if there were any wish upon the part of the company to evade it.

17,469. (*Chairman.*) Do you conceive it has ever been the practice of railway companies to allow advantages to certain parties by means of rebates?—I have heard that that has been done. I could not say of my own knowledge that it has been done, but I have been told that cases of that kind have arisen. I have been told that we are charging too much. I have quoted a rate of another company to show that we are charging the same as that company, upon which I have been told by the parties sending the goods, "Yes, that is all very well; that is their "charge, but we get a rebate." How far that is true I do not know. I can only speak to it from what I have been told by the parties themselves.

17,470. Can you say whether it is ever the practice to allow indulgences to certain traders by not compelling them to pay as regularly as others?—Certain traders whose accounts are large are allowed to open monthly accounts with the company, and pay at the end of the month for the business of the month, but where a trader's accounts are small, and he only sends a small quantity of goods, it would not answer our purpose to open a ledger account with him. Our practice constantly is to open accounts with large traders.

17,471. (*Mr. Glyn.*) You are regulated as to that by the question of convenience between the traders and the company?—Entirely.

17,472. (*Mr. Horsfall.*) Do you allow any discount?—No, the rates given are the exact figures that we claim.

17,473. (*Mr. Glyn.*) When you make a reduction of rates you generally give general notice of it through the district to which it applies?—Yes, it is soon known through the district when there is a reduction of rates.

17,474. You take some steps to make it known, do you not?—Yes. A reduction of rates is generally made from some pressure put upon us by freighters, or some arrangement by certain parties who are interested in a reduction of rates. It is made known at once when the reduction is agreed upon.

17,475. (*Mr. Horsfall.*) It is to your interest to make it known with the view of getting additional traffic?—It is to our interest to make it known.

17,476. (*Chairman.*) Do you see any objection to a maximum of terminal charges being fixed by Act of Parliament?—I am not a very good witness upon such a matter as terminals, because there are a good many complications mixed up in that question, and it has never been a matter that I have had occasion to give my attention to.

17,477. Have you considered the policy of making considerable reductions in the passenger fares and in rates for goods?—Yes, I have very often considered that.

17,478. What are the results which you have arrived at?—I do not think that either the fares or the rates admit of any reduction. I think, with reference to the increase in wages and the increased expenses of railway companies, that we ought rather to have some improved rates than a diminution. We cannot be going on reducing on one side of the account while we are swelling the other.

17,479. Do you think raising the present fares would increase your gross receipts?—What we care about is not so much the gross receipts as the net divisible balance. If we can get less receipts at a much greater cost, that is the figure that we are interested in.

17,480. (*Capt. Galton.*) In fact, if you carried less at a higher price, you probably would make a better thing of it?—No doubt we might.

17,481. (*Chairman.*) Does that apply to passengers?—It applies to all, I think.

17,482. Would it answer to carry a small number of passengers at increased fares; do you think that would pay a railway company better than carrying large numbers at low fares?—What would answer the purpose of a railway company the best would not be the diminution of weight of a particular train to a small extent, but if there was a considerable diminution in the number of passengers we might diminish the number of trains, and the saving to us would become very palpable. For the purpose of accommodating the public we now run a great many more trains than the traffic requires, and the consequence is that our receipts per train mile are much less than they ought to be.

17,483. (*Mr. Glyn.*) About what is the average loading of your passenger trains; is it one-third?—It is more than one-third, I should think. It depends very much upon the district. Out of London it is a great deal more than one-third on the heavy portion of our line; but I dare say on our branches it is not nearly one-third.*

17,484. Do you average one-third all round?—Yes, I think we do.

17,485. Do not your express trains out of London average two-thirds, or more than that?—Yes, they do. There is one difficulty which we feel very much with our trains out of London on a line like the Great Western, and that is, that the public do not like changing carriages, and the consequence is we are obliged to put on the trains going out of London a great many more carriages than are necessary for the traffic leaving London, in order that the public may be able to reach their destination without changing carriages.

17,486. (*Lord Stanley.*) Do you find that the public expect to have far more room than they actually require?—Yes, you will find passengers walking along the trains to see if there is an empty carriage, as if they wanted to travel alone. There is no doubt in this country we have to carry passengers much more commodiously than they do on the trunk lines abroad.

17,487. (*Chairman.*) Then you are decidedly of opinion that any reduction of fares would be prejudicial to the interests of the companies?—That is quite my opinion. I think we are not in a position to reduce our fares or rates without some special case arises. We do reduce our fares in special cases. We give excursion trains where we are likely to get a very large number of people together. That does not apply to our general traffic. People will not constantly travel because they can go cheaply; you must get them together, and enable them to go cheaper as an excursion. But we do not find towards the end of the year, when people have had their run, that excursion trains pay. They then begin to fall off very much.

17,488. (*Earl of Belmore.*) Do you not find that people who are obliged to take journeys only upon a few occasions in the year wait for the excursion trains?—Yes, they actually write to us to know when we are going to run our excursion trains. I do not think that on the whole the excursion trains pay us much.

17,489. (*Capt. Galton.*) If you were to run more third-class trains than excursion trains, do you not think you would get more traffic?—Our third-class traffic is a very good traffic.

17,490. It is not much developed?—Yes, it is.

17,491. As a rule have you more than two third-class trains each day?—Yes, we even put third-class carriages on to our fast trains.

17,492. On all your trains?—No, not on all our trains, but to some of our fast trains in addition to our ordinary third-class trains. We bring up third-class passengers from Bristol. We put on third-class carriages to the quick trains from Falmouth to London, whereby third-class passengers are enabled to get through in the course of a day, which ordinary third-class trains would not enable them to do.

17,493. (*Mr. Horsfall.*) When you spoke of excursion trains not paying, you spoke only of the Great Western, and not of railways generally?—I am only speaking of what I know.

* See note at end of evidence.

Mr. D. Gooch, M.P.

15 May 1866.

17,494. (*Mr. Glyn.*) Do you think, on the whole, excursion trains answer?—I do not think we earn much by excursion traffic. I think it is to a large extent accommodation given out of our own pocket. We run great risks. I do not think we get much by it. When we run an excursion train our traffic to the points to which that excursion train goes is much lighter both before and after. That is a well recognized feature of excursion traffic.

17,495. There is a further disadvantage, that in some degree it interferes with your regular traffic at the season when the excursion trains are running?—Yes, it does. Of course we endeavour to avoid that as much as possible. If we put these long trains on to our line they are more or less inconvenient, because an excursion train to be a paying train must be a long train.

17,496. (*Earl of Belmore.*) As a general rule do you not find that there is in practice more liability to accident with slow passenger traffic than with the express traffic, such as accidents arising from collisions?—I do not know that I can say that. The express train is what may be called the crack train on the line, and our people are more on the look out for the express than the ordinary trains. I do not think there is any real difference.

17,497. (*Mr. Glyn.*) There have been greater facilities afforded of late years for the forwarding of goods and passengers between the respective companies throughout England, have there not?—A great deal. I think it is our interest to do that to the utmost extent to which it can be done. I think the harmonious working of railway companies is very important.

17,498. You see a disposition upon the part of the great companies to encourage that, do you not?—A very great disposition. The more that can be done by the railway companies in that direction, instead of competing with each other as they have been doing to a great extent, the better. If they were to carry that out more than they have done, they would be serving their own interests much better as well as the interests of the public; they would do better for the public and earn a great deal more money for themselves. For instance, take the traffic from London to Birmingham; there is only a certain amount of traffic from London to Birmingham. If the North-western were to agree with us that that traffic should be carried in the manner that is most for the advantage of the public; the two companies might so arrange the trains that the public might be able to leave London by nine o'clock from the Paddington station or the Euston station and all go by that one train at that hour, and the other company might have another train at a convenient hour. The saving that would accrue to both companies by that arrangement is manifest, and it would enable the companies to give greater accommodation to the public.

17,499. (*Capt. Galton.*) If they could go by one line and return by another they would be able to economize their time in all probability?—I am quite sure the nearer the larger companies work in harmony the better both for themselves and the public.

17,500. Could not arrangements be made whereby a passenger taking a return ticket might go by one line and return by another?—Yes, it could be worked in this way; suppose two companies are working to given towns in a given district. Instead of unduly competing for that traffic, they might say we will divide the traffic and give the public all the accommodation that can by possibility be wanted, instead of running duplicate trains at the same time, one only doing half the work. We should thereby each save a large sum, and the public would not be inconvenienced in any way.

17,501. You think they might work the traffic jointly and divide the receipts?—Yes; in some fair proportion according to the position of the parties.

17,502. (*Sir R. Hill.*) That is done now on some lines, is it not?—Yes; it is done, but the more it is done, I believe, the better it will be for everybody.

17,503. (*Chairman.*) Are there instances of arrangements of that kind between the Great Western and the South-western?—Yes; we divide the traffic from Reading with the South-western and the South-eastern.

17,504. You have ceased running your trains at the same hours, have you not?—We have not got to that point, because we run trains to very different districts.

17,505. The intermediate traffic is more important than the through traffic?—Yes; but we do divide the Reading traffic in certain proportions between the three companies.

17,506. (*Earl of Belmore.*) Have you not an agreement with the North-western scheduled to your Amalgamation Act of 1863?—Yes; we have.

17,507. Does that apply to passenger traffic?—It applies to everything, it applies to all the business of the companies.

17,508. (*Chairman.*) Can you make any suggestions for further facilitating the interchange of traffic throughout the country?—No; the only suggestion I have to make is one which I have already made, and which we did discuss with the North-western and the Midland, feeling that that should be the principle that should guide us in our intercourse.

17,509. (*Sir R. Hill.*) I suppose the real difficulty in carrying out such arrangements is in determining the share of each company?—That is a simple difficulty, because we refer that to arbitration when we do not agree. One of the greatest difficulties in all these arrangements between companies has been these absurd contractors' lines which have been forced upon us in all directions. We fear that Parliament and companies are too much inclined to encourage some of them. They are difficulties in the way of arrangements which would have been made had it not been for these companies, which exist without a single 1*s.* having been subscribed to make the lines, or a single sod having been turned towards the construction of them.

17,510. (*Capt. Galton.*) Would not facilities for interchange of traffic be more materially advanced, with respect to your line, if you had the narrow gauge instead of the broad gauge?—Yes, they would. I am an old broad-gauge man, but there is no doubt that circumstances have changed very much during the last 15 or 20 years, and the time has come when we have very seriously to consider how the question of the narrow gauge is to be met. We shall either have to change our gauge to a great extent or double it to a great extent, and there is no doubt it will be in the interest of the public to do so. That is a question we are now considering.

17,511. In fact it is a question of very great importance to the whole of the community as well as to yourselves?—It is a very serious question to us; in point of money it is a very large question.

17,512. (*Chairman.*) In your case it would entail a very large expense through having to change the rolling stock?—The change of rolling stock would be a very large burden, because a great portion of the present rolling stock is broad gauge.

17,513. Would it be possible to adapt any portion of that to the narrow gauge?—I think the waggons and carriages to a certain extent might be adapted, but the engines could not, because the broad-gauge engine is too wide in the boiler for the narrow gauge, therefore there would be no possibility of adapting the engines to the narrow gauge.

17,514. Could not your engines be adapted to the Irish gauge?—I think very few of them. Most of our engines are already wider even than the Irish gauge.

17,515. (*Sir R. Hill.*) Do you think that the broad-gauge carriages might safely be run upon the narrow-gauge lines by placing the wheels nearer one another?—No; I do not think they could, I think they would be overhanging too much to be comfortable. I do not think that would do. The change of gauge would not alter all our stations and platforms and things of that kind, which are now constructed to allow of overhanging to a fixed extent. I do not think that even the tunnels would be clear. It would necessitate an entire alteration of the stock.

17,516. (*Mr. Glyn.*) Have you considered the question of forwarding goods between companies, as to whether any more stringent regulations than now exist are required for the purpose of securing quick and regular forwarding?—I think it is so much to the interest of the companies themselves to get the traffic on the line, that the public cannot have a stronger interest than we have.

17,517. You would not allow one company the right to call upon all other companies up to a given point to forward their traffic, and then leave the question of payment to arbitration, should you be afraid of that?—I think if any company had the power of calling upon another company to run special trains constantly over their line, that its exercise would entail a great deal of risk.

17,518. The question of payment for special trains would of course be a matter for arbitration?—I think that it would lead to such constant arbitrations that we should always be in hot water. I think if it will not work without such arbitrations that it will not work at all. Our interest, of course, at present is to get every ton of goods that we can.

17,519. You think that could be left to the interests of the companies themselves?—I think it is their interest, and their interest is much stronger than an Act of Parliament.

17,520. (*Chairman.*) Do you think that any difference might be established with respect to perishable goods from the ordinary traffic, and that there should be stringent powers with reference to forwarding perishable goods without delay?—We are punished as it is, very severely, if we do not forward perishable goods.

17,521. You do not have to pay for them where you receive them from other companies?—We have to pay for them if we receive them at all. If a delay takes place upon our line, of course we should be liable. An action might lie against the person receiving, but the question has been settled that we are ultimately liable.

17,522. (*Sir R. Hill.*) But you are only bound to forward them by the first train after you have received them?—Of course, only by the first train; but with regard to perishable goods there is an organized system. We know what day they are coming, and we know the districts they come from. Our trains are regulated for the purpose. Our object is to get perishable goods. It is a good traffic, and a very profitable one to get. We have to get them into London in time, because if we do not get them into London in time people will not send them. Therefore it is our interest to get the traffic and do the work in the best way in which it can be done.

17,523. (*Chairman.*) Are the mineral waggons on your line chiefly owned by the company or private traders?—I should think the bulk of them belong to us, but we have a great number of private waggons on the line.

17,524. Do you find any inconvenience result from there being a number of waggons belonging to private parties?—Yes; one great inconvenience is the difficulty of getting the private traders to keep them in that state of repair which we keep our own in, and the consequence is, that even with reference to the question of greasing those waggons we have had a great deal of difficulty. The quantity of grease used by them is something extravagant, from the neglect of the bearings. The greasing has hitherto fallen upon our shoulders, and has been a very serious expense to us. We have been calling the attention of these parties to it, and we have determined that if they do not alter their practice we shall charge them for the greasing.

17,525. A smaller quantity of waggons belonging to the company will do the work better than a larger quantity when they belong to private owners?—No doubt; the spare stock of the company, if it is not wanted for one district, could be used for another; if they are not wanted in Birkenhead they can be used in South Wales.

17,526. But private owners do not allow their waggons to be used by other parties?—No, they all go back empty.

17,527. You can get more work out of a waggon if they belong to the company than if they do not belong to the company?—I think, as the coal trade has been carried on, that you cannot make use of the return empty waggons; you must devote certain waggons to that particular trade. The working of coal depends upon the regularity of the supply, therefore the result is, that we do not carry other goods in our return coal waggons, which are made up into certain trains, and go backwards and forwards with the most perfect regularity that we can maintain.

17,528. I believe it is the fact that the signal system on the different lines varies considerably?—Yes, there is a difference upon the different railways, although it is becoming much more uniform than it was.

17,529. Are there any advantages resulting from different companies having different systems of signals?—No; there is no advantage at all. Each railway company thinks its own class of signals the best. We used to have what we call the disc and cross bar signal, which is a very good signal, and easily worked, and is the signal used now upon the Great Western main line; but upon a great many portions of our line the semaphore signal is the signal we use, because it was in use upon the different lines which have amalgamated with us.

17,530. Have any accidents been caused by different companies having different signals?—I cannot call them to mind. I cannot remember any accident which has resulted from the use of different signals.

17,531. Then you are of opinion that the establishment of a general system of signals would probably not be attended with any very great public advantage?—I do not think it would, because the enginemen who work over these different lines are accustomed to the road; they are not allowed to go by themselves until they are accustomed to the road. It is not as though any railway company might run over our line; it is only, as a rule, our own men who run over our own line, and therefore they are acquainted with the signals. A man who works between Paddington and Swindon may never work on any other part of the line at all; he is confined to that district.

17,532. (*Mr. Glyn.*) Have you the telegraph from station to station?—From Didcot to London, where the traffic is very thick, we have the block system.

17,533. I believe you carry the system of through-booking to a great extent upon the Great Western?—Yes, we do.

17,534. And with other lines also?—Yes.

17,535. In fact, you carry the facility of through-booking as far as it can be carried?—We carry it as far as we can get other railway companies to unite with us in doing so.

17,536. Do you find general willingness to meet you upon the part of other companies?—Yes, unless there is some local question between the companies which may affect it. Competition sometimes may have an influence on the companies.

17,537. But that, in fact, works itself as between the companies without the necessity of any interference?—Yes, it may be taken as a rule that the companies are anxious for it, and, for their own interest, give facilities for through booking.

17,538. (*Chairman.*) Are there any instances in which competition is maintained for any considerable length of time?—I suppose competition is continuous to a certain extent, but not the kind of competition which there was at one time, and which had the effect of lowering the rates very considerably between London and Manchester, and London and Reading, when, in fact, people were carried almost for nothing. Such hot fights of competition as that do not last long.

17,539. There have been no instances of that kind for some years?—I do not think there have been any for the last seven or eight years.

17,540. (*Mr. Glyn.*) The system of competitive reduction of rates has ceased?—I think it has.

17,541. The competition for accommodation still

Mr. D. Gooch, M.P.

15 May 1866.

goes on?—Yes, and there is a sort of competition which still exists, by means of touting and looking after traffic, when the companies have their own agents. It is a question of how to get the most traffic you can, and then the parties will give it to whichever company they think suits them best.

17,542. (*Mr. Horsfall.*) They agree to charge the same rates?—Yes, generally there is the same rate.

17,543. (*Chairman.*) Do you think that the rates on the whole have been lowered by competing lines?—Yes, I suppose in some cases they have been lowered by competing lines.

17,544. It used to be stated that after two competing lines had come to an agreement, they would both agree to raise their fares; has that practically been the consequence?—Of course, they have raised their fares beyond that which they were competing at; but they have not raised their fares, in any case that I know of, beyond what the fares were before the fight began.

17,545. Have they been generally the same as they were before the fight began, or have they not, in most cases, settled down to a lower point?—It has been the tendency to settle down to a lower point. The tendency has been a reduction in the rates on goods and passengers.

17,546. (*Sir R. Hill.*) Have not the lower fares been maintained, because it has been found that the lower fares were more profitable than the higher?—Not as a rule. I think, in some cases, a low fare has been taken on special occasions, either on an actual market day or other days; when we can tempt people to go to market by lowering the fares, we give them facilities on those occasions. I do not think merely reducing the fare tempts people to travel. The working classes have not the time to travel. A man who has a necessity to travel does not care whether he pays 2*s.* more or less from London to Bristol.

17,547. I am speaking of instances in which the fares have been lowered by competition, and after the competition has ceased the low fares have been maintained?—There are instances in which that has been done.

17,548. Was there any other reason for maintaining low fares than that they had proved more profitable than higher fares?—No; it would be entirely a question of receipts to the company, without there was competition at the same time. There is always some feeling of competition.

17,549. The competition having lowered the fares, the companies found it to be their interest, or considered it to be their interest, not to put the fares again quite so high as they were before the competition?—I think it will be found, where fares have been reduced in that kind of way, that it has been more local than general, and has arisen from local circumstances, owing to the nature of the traffic. For instance, take the district between Birmingham and Wolverhampton. I have no doubt that low fares between those places would induce people to go Birmingham or to Wolverhampton, because a man might easily do that, and yet only be absent from his business an hour or so; but with regard to a longer distance, as a general rule over the railway I do not think that persons can be dealt with in the way that is suggested. It is merely those local cases, arising from circumstances which do not affect the whole question.

17,550. (*Chairman.*) You have a large amount of mineral traffic on your line?—Yes, we have a great deal of mineral traffic from South Wales, North Wales, and the Radstock district.

17,551. Do you bring coals to London and that part of England?—Yes, especially from North Wales and South Wales.

17,552. Can you state how much the coal charge is per mile?—We carry now from South Wales to London at three-eighths of a penny per ton per mile.

17,553. Do you think that that low rate pays you?—It has only been tried a short time. It was a reduction that was made last year. I think it is a very low rate. Of course, a great deal depends upon the question of the rate per ton on goods and minerals upon the nature of the gradients. What is a very fair rate as between Swindon and London is a very bad rate indeed over gradients where we can only take one-third or one-fourth of the quantity that we can take between Swindon and London.

17,554. Where you charge three-eighths of a penny do you find waggons?—No; the rate that would suit us, for instance, over our main line would not suit the South Devon or the Cornwall lines where there are gradients of one in 60; such lines as those cannot carry coal at that rate.

17,555. (*Mr. Glyn.*) You could not carry it at that rate, unless there were full loads?—No; even then it is too low.

17,556. (*Mr. Horsfall.*) How many tons can you carry in a load?—500 tons, from Swindon to London.

17,557. (*Earl of Belmore.*) What is your worst gradient?—Our worst gradient is four feet a mile. It is pretty nearly level. We have two very steep inclines between Bristol and Swindon, one of which is the Box tunnel.

17,558. (*Mr. Glyn.*) Is your starting load 500 tons?—No, we have to come over the line between Gloucester and Swindon and have gradients of one in 60.

17,559. (*Earl of Belmore.*) What is the worst gradient of the line between Bristol and Swindon?—One in 100.

17,560. (*Mr. Glyn.*) You charge three-eighths of a penny for the whole distance?—Yes.

17,561. You make up your full load only at Swindon?—Yes; we increase our load from Swindon to London. We do not as a rule get 500 tons. The rule ought to be so, but the difficulty is to get the coal with that regularity which will enable us to work it so as to get full trains up to Swindon, and bring them on to London.

17,562. How long have you tried this rate?—I think it was somewhere about last June or July that we commenced. It was just before I took the chair of the Great Western. I do not know the date exactly.

17,563. (*Chairman.*) Has the tonnage of the coal traffic materially increased since these low rates were commenced?—The tonnage has increased, but our proportionate receipts have fallen off very considerably. As regards our comparative net receipts we are worse off for the change.

17,564. What were your previous rates?—Our previous rates were from $\frac{7}{16}$ths of a penny to a halfpenny.

17,565. (*Earl of Belmore.*) You mean that your net receipts have fallen off?—Although we have done much more work, I do not think we have made so much money. We are losers by it.

17,566. You have not so much available for dividend as you had before?—No, I think not.

17,567. (*Chairman.*) Do you consider when you have made an experiment of that kind that you can go back again to your old charges when the experiment has not proved successful?—It is very difficult to do so; but the understanding in this case was that it was by way of experiment. We are carrying to Birkenhead from South Wales at the same rate.

17,568. You have expressed a strong opinion against what are called speculative lines; have you any suggestions to make with respect to the course that it would be right for Parliament to pursue with regard to the sanction of new lines?—The system which was in operation at the early period of railways, when it was necessary to prove subscription contracts and so on, although I admit it was very much abused by the signatures being obtained without any guarantee of their soundness, was a good one. If a line is brought before Parliament, Parliament ought not to sanction it without being satisfied that it is a *bonâ fide* line, and that the money is forthcoming to make it. Under the present system an engineer, a contractor, and a lawyer will promote a scheme; the contractor will probably find the interest upon the deposit; they will introduce the scheme and get it through Parliament. It costs railway companies very large sums of money annually to fight these lines in Parliament. It

cost us last year 40,000*l.* merely to protect the company against these lines in Parliament. They are lines which are not intended to be made *bonâ fide* by the promoters when their acts are obtained, and there are no means of constructing them without they get other companies to aid them.

17,569. Are not those lines generally taken up by one or other of the large companies after the acts have been obtained?—I hope that will not be the case any more. We have made up our minds not to do so, and I believe the North-western have done the same. We will leave them to fight their own battles for the future. The jealousy that has hitherto existed between railway companies has unfortunately given much encouragement to that kind of lines.

17,570. (*Mr. Glyn.*) Then you think it would be expedient to return to the old system of subscription contract, but that Parliament ought to take some means of seeing that it was a *bonâ fide* subscription contract?—Yes; care is taken by business people who take bills for a large amount to ascertain that the man who puts his name to a bill is able to meet the obligation when it falls upon him. In the same way when a man puts his signature as being responsible for a large amount to a subscription contract, an investigation ought to be made that he is really worth the sum for which he has put down his name. I think that the rule with regard to subscription contracts should be, that every man who puts his name down enters into an obligation that if needful he is to find the money for which he has put his name down. With regard to railway companies who go before Parliament for bills, Parliament has the security of their railways, but there is no security whatever against the buccaneering schemes of lawyers and contractors which are now infesting the country. It is a serious curse to railway companies, not only through their being obliged to keep their staff half the session employed in fighting them before Parliament, but in the outlay of money that is incurred in doing so.

17,571. (*Mr. Horsfall.*) Do you not think that these speculators would still be able to evade what you are now suggesting?—I would try to prevent it. They used to evade it by getting the signature of anybody who chose to write his name down for 10,000*l.* or 20,000*l.*, and who had not as many farthings.

17,572. (*Mr. Glyn.*) They will try to do it?—No doubt they will try to do it. I would throw the responsibility upon the opposition and the committee of investigating every signature. If the opposition had an opportunity of bringing proof before the committee that a certain signature was the signature of a man who although he had put his name down for 10,000*l.* or 20,000*l.* was not worth as many farthings, I think very few of these bills would get through Parliament.

17,573. (*Mr. Horsfall.*) Do you not think that that would be rather an inquisitorial system to adopt?—Not in the least. If you put your name to a bill, the man who takes it inquires whether you are able to meet the obligation which you incur, and I do not see anything inquisitorial in investigating into the responsibility of a man who chooses to write his name against a large sum of money in a subscription contract.

17,574. If the individual enters into the contract he does it with his eyes open?—If I were to enter into a contract with you to do some work I must satisfy myself that you are able to execute the work. I do not think an investigation by Parliament of that sort would be more inquisitorial than that.

17,575. (*Chairman.*) A considerable portion of the parliamentary expenses have arisen from conflicts between different companies?—It has to a great extent more or less. Of late there have not been such contests between railway companies that there used to be.

17,576. You do not think it desirable to put an end to those contests?—No, I do not think that there will ever be again that amount of competition that there formerly was.

17,577. (*Mr. Glyn.*) Does it not become a matter of very serious inconvenience to the staff of the great railway companies who are obliged to attend the Committees of the House of Commons for the purpose of fighting these lines that you have alluded to?—It is a serious loss to us. For instance, Mr. Grierson, the general manager of our railway, and our secretary, are really from the commencement to the end of the session spending their time at Westminster. That is not the place for them; they ought to be on the line; it is a very serious loss to us. They are the only men of that stamp who can do the work at Westminster, owing to the details that they have to deal with.

17,578. (*Chairman.*) Do you think amalgamations of this large class have been carried as far as it is expedient that they should be carried?—Yes, I think the amalgamations of the large companies have gone far enough. The public think that they will be injured if the amalgamation of the large companies is extended. I believe the facilities afforded by amalgamations might to a great extent be obtained without actual amalgamation; I do not know that amalgamation may not be carried too far.

17,579. (*Mr. Glyn.*) I presume you think that the Great Western, the North-western, and the North-eastern are sufficiently large in themselves for any board to manage?—They are quite sufficient for any staff to control, because one mind must control the one system.

17,580. (*Chairman.*) Do you find any inconvenience arises from the extent to which your company has carried amalgamation?—Ours is a very large concern, and I do not know if it were smaller whether it might not in some respects be better managed.

17,581. You think, with all the care of the directors and the officers of the company, that some points get neglected?—Our systems extends over 1,400 miles, and of course it is almost impossible for our supervision to be so effective in every respect as it should be.

17,582. (*Mr. Glyn.*) There is some advantage in the long run it gives you to different points, is there not?—We do not get the full advantage of that. Our engines only run a certain distance, and then they are changed. I do not know that a long run is a matter of much consequence.

There is one point which I wish to mention, and that is the question of a communication between the guard and the engineman. There is a strong feeling in the minds of many that there ought to be a constant communication between the passengers and the guard, and after that between the guard and the engineman. As to a communication between the passengers and the guard, I do not see that there is any necessity for it. If the Board of Trade returns are referred to, going back for years, I believe not a single case will be found, and certainly in my experience of the Great Western there is not one case in which the accident could have been prevented by any communication between the passengers and the guard, or the guard and the engineman. The first intimation that people in the train get of an accident, where injury has arisen, is the accident itself; it is all over before they have time to think of it. But if it were in the power of the passengers to stop a train, and that was really brought into practical use, the stopping of a train upon a main line of railway unexpectedly, with other trains following it, as they do now on many parts of the line, every five or ten minutes, would be highly dangerous. Take the North-western; the trains almost keep within sight of each other. The danger we have now, if an accident happening on the line, either to a waggon or to an engine, arises from the difficulty of getting back in sufficient time to stop another train running into the one which is disabled. It will be found that many accidents of that kind have arisen from there not being time to get back to stop the succeeding train. I do not know that the mere stopping of the train by the passengers could have prevented any accidents.

17,583. I believe this question has been very much discussed by railway managers, has it not?—Very much indeed. There is a public clamour about it certainly, but I do not know any railway officer who has had much experience in railways who does not look upon it as fighting with a shadow. It would be

Mr. D. Gooch, M.P.

15 May 1866.

introducing an evil which they do not know the extent of.

17,584. Do they not even carry the objection further, and say that it would be really introducing an element of danger ?—I have no hesitation in saying that certain danger would be introduced into the railway system by giving any such power to passengers.

17,585. (*Sir R. Hill.*) It has been proposed that the passengers shall simply inform the guard that danger exists, leaving it to the discretion of the guard to stop the train or not; do you see any objection to that ?—I do not see that it gives any practical result. If a passenger signals to the guard that there is danger, the guard cannot tell by stopping in his box what the danger is. It is left to the discretion of the guard whether he will do a certain thing or not. If the passenger can tell the guard what his fears were, and explain to him exactly what the danger was before the guard was called upon to act it might be practicable, but upon the mere intimation of the passenger to the guard that he thinks there is danger the guard is left to act; the guard must either act upon that or he must take the responsibility of not acting upon it. What is he to do? His orders must be that he must at once stop the train if the thing is to be carried out.

17,586. Have there not been instances in which part of the train has been on fire, which would have been manifest to the guard if his attention had been drawn to the circumstance that there was something wrong ?—I think that the guard must know when a train is on fire, because he rides at the tail of his train, and would see it.

17,587. Have there not been cases, even upon the Great Western line, in which a train has been on fire and which the guard has not known of for a very considerable time ?—No; the only case in which a train was on fire was in the case of a train coming into Paddington station. A spring of one of the carriages had broken, and the wheel coming in contact with the iron guard which there is in a sort of well inside the carriage, made that hot, and set the carriage on fire. That was found out, and the train was pulled up outside the Paddington station. There was no communication between the passengers and the guard. That is the only case which I know of as happening in 27 years. By introducing such a system you will be introducing an evil which will be a certain one for the purpose of curing an evil which may happen once in 27 years, and certainly will not happen continuously.

17,588. (*Chairman.*) Is it not the fact that railway managers have been consulting with one another upon the subject ?—Yes.

17,589. (*Sir R. Hill.*) The practical question is whether the arrangement might not introduce more danger than it would prevent ?—I do not think it would prevent any danger. I go so far as to say, that if you take the Board of Trade returns and look at the accidents that have occurred, in no case would such a facility have been of any use. You must see first of all the evil you have got to cure before you attempt to cure it. There is no such evil, in my opinion, existing which deserves to be called an evil. I have been told that because a man was murdered in a carriage on the North London that it is a monstrous thing that passengers are not able to communicate with the guard. If you are going to murder a man you do not tell him so. I look upon it as a very serious evil. I see there is a bill in Parliament which proposes to introduce something of the kind.

The witness withdrew.

Note to No. 17,483, *and following questions.*—The annexed is a table showing the receipts per passenger and goods' train mile, on the Great Western Railway, from 1849 to 1865, exclusive of the Shrewsbury lines, which shows the effect that a reduction of fares and rates, the opening of branch and other lines, and other causes, has had in reducing the receipts per train mile, notwithstanding the increase of traffic, and the increased power of locomotives, &c.

GREAT WESTERN RAILWAY.

Mr. WILLIAM WAINWRIGHT examined.

Mr. W. Wainwright.

15 May 1866.

17,590. (*Sir R. Hill.*) You are, I believe, secretary to the Glasgow and South-western Railway Company?—Yes, I am.

17,591. In the last report of that company we find the cost of locomotion for passenger trains stated at something less than 5*d.* per mile?—That is so.

17,592. Can you explain how it is that the expenditure is so much lower on your line than on the lines of any other companies?—I think one main reason is, that the cost of fuel in our district is lower than in any district of the kingdom. The Caledonian are also much in the same position. In the year 1864 the average cost of coal for our locomotive power was 4*s.* per ton only, but this year, owing to there having been a general increase of wages amongst the colliers, it has increased to 5*s.* Then, again, we run a longer train mileage in proportion to the amount of traffic than almost any other line. I have made a statement taken from the Board of Trade returns which includes the lines worked by the different companies, and shows the expenditure, including the rates and taxes, and all outgoings on the revenue account. I find that we earned on the average for the year 1864, which is the last published report of the Board of Trade, only 4*s.* 0½*d.* per train mile, whereas many companies earn between 5*s.* and 6*s.*, and some upwards of 6*s.*

17,593. (*Mr. Glyn.*) What is your length of mileage?—The mileage of our line is 250 miles.

17,594. And your average earnings?—Do you mean per train mile?

17,595. Yes?—4*s.* per train mile.

17,596. (*Sir R. Hill.*) Are there any expenses omitted in your statement of the cost of locomotion which are usually included in that amount?—No, every possible expense is included.

17,597. Does it include repairs of engines?—Yes.

17,598. And the renewals?—The renewals, and wages, and materials of every kind; in fact, each of the items you will find in the abstract B. of our report.

17,599. Then we may assume that it is a correct statement?—Perfectly correct.

17,600. And that the difference arises from the low cost of fuel?—It arises chiefly from that. Then, again, wages in Scotland are generally lower than in England. For instance, the average wages of the engine-drivers on our line vary from 24*s.* up to 36*s.* per week, whereas on a great many of the railways in England the men get 42*s.* per week.

17,601. In another part of the same report the expenses per train mile, including all the expenses which are incurred, are stated to be 1*s.* 3*d.*?—Yes.

17,602. That, again, as you are probably aware, is much below the ordinary average; can you explain how that occurs?—That, I think, principally arises from the fact, as I said before, of our running such a large train mileage, because, taking the general expenses of last half-year, 8,197*l.*, those expenses are not at all affected by running any additional trains. Suppose we run another 100,000 miles in one particular half year, those general charges are not increased, but the average per train mile is reduced. There are a great many other items which are precisely in the same way; for instance, maintenance of way may not be much increased.

17,603. But all expenses usually included under that head have been included in this report?—Yes. There is one expense which in some companies is dealt with in a different way. We have a contingent account for the renewal of way, and we charge a certain sum every half year, 10,000*l.*, against revenue on that account, but that does not come in in the ordinary expense of the 1*s.* 3*d.* that you have taken. That would add 2*d.* per train mile to the cost.

17,604. (*Mr. Glyn.*) You think that ought to be added?—Certainly it ought.

17,605. (*Sir R. Hill.*) That would make the expense about 1*s.* 5½*d.*?—Yes.

17,606. (*Mr. Glyn.*) Is that the only item?—That is the only item that is left out as compared with other companies, but that is not the only working expense. I may mention that the Board of Trade returns include everything chargeable against revenue, and in that way you get rather a fairer comparison than you do in taking the accounts of the companies, because some people charge them in one way and some in another.

17,607. No other item is omitted than the one you have mentioned?—No other item at all.

17,608. Does it include taxation?—No, not in the 1*s.* 3*d.*, but that is not generally considered as a working expense. Taxation is included in the returns of the Board of Trade, but in all the accounts of the railway companies we do not look on taxes as part of the cost of working the railway. It is an incidental charge.

17,609. It is not included in the statement of the other companies?—No.

17,610. (*Sir R. Hill.*) It is included in the establishment charges?—Yes. If you will allow me to put in the paper which I have prepared from the Board of Trade returns with reference to the total traffic receipts and total expenditure of all the large companies, showing the per-centage of the expenses as compared with the receipts, it will be found that the per-centage of our line, which is 47 per cent., is the exact average of the United Kingdom, and that, although per train mile our expenses are exceedingly light, when taking the per-centage of the amount earned, our per-centage is only the average.

The witness handed in the same, which is as follows:—

Taken from BOARD of TRADE RETURNS.—Includes LINES worked by the respective COMPANIES.—EXPENDITURE includes RATES and TAXES, and all OUTGOINGS on REVENUE ACCOUNT.

17,611. (*Chairman.*) Which do you think is the fairest way of estimating the expenses, by taking a per-centage of the traffic, or by taking a per-centage of the train mileage?—I think a per-centage on the traffic; because you may extend your mileage to such an extent as only to show a very slight amount of expense indeed. For instance, the half-year ending 31st July 1862 the per-centage of the working expenses was 40¼, the cost per train mile was then 1*s.* 8*d.*, and we were earning about 4*s.*, just about the same as we are now. We have extended the train mileage very considerably, though the earnings per train mile remain the same, and the cost is now only 1*s.* 3*d.* as against 1*s.* 8*d.* in 1862.

17,612. (*Sir R. Hill.*) Can you tell us what is about the average number of carriages included in your passenger trains?—I should think about six or eight.

17,613. They are unusually short, are they not?—Yes, some of them are. We run very frequent trains in some parts of our district.

17,614. Would not that in part account for the unusually small expense of the passenger trains?—Yes, it certainly would to some extent. Of course the locomotive expenditure would not be quite so great with a light train as a heavy train.

17,615. Are you prepared to say what would be the additional expense of adding another carriage?—No, I scarcely could. The additional expense of one carriage would be very slight, but comparing a light train and a heavy train, there would certainly be a greater expenditure of fuel.

17,616. The principal causes of the expenses per train mile being less with your company than others are, first, that you do not include in the expenses the renewal and repair of the road, and, lastly, that your trains are unusually small?—Yes, we do no include the renewal of the road.

17,617. (*Chairman.*) Is the cheapness of fuel in your district such as to affect the per-centage of working expenses?—Certainly it does.

17,618. (*Sir R. Hill.*) Do you burn coal or coke?—Coal almost exclusively.

17,619. (*Chairman.*) What does your traffic chiefly consist of?—Minerals. Nearly half our traffic is minerals.

17,620. How do you divide the cost of maintaining the permanent way as between passenger trains and minerals?—We take the whole mileage, and divide the cost equally.

17,621. Do you think the cost of the permanent way should be fairly divided between the passenger and goods traffic in proportion to the wants of each?—No; we do that here because there is, perhaps, no particular reason why we should not; but I think certainly goods and mineral traffic must wear out the permanent way more than passenger traffic, though on the other hand the quick passenger trains require a more perfect road.

17,622. Are you of opinion that any economies have been introduced on your line which are not generally practised by other companies?—I am afraid that I can scarcely give ourselves credit for any better management than our friends.

17,623. Your experience does not suggest any mode to your mind by which the working expenses generally could be reduced?—No, not as regards one particular railway; but I think the working expenses as between the different railway companies might be reduced by an altered arrangement of the trains. In many cases there are a great number of trains more than is necessary, because of two companies competing in the district. The public would still be as well served by a smaller number of trains.

17,624. Do you mean that if your company and the Caledonian made arrangements with one another, for instance?—Assuming that we and the Caledonian had an arrangement with regard to our traffic to Dumfries, we might save expense in not running so many trains, because we now run seven or eight trains a day each to serve that district.

17,625. (*Sir R. Hill.*) Have you ever attempted to make such an arrangement?—We have an agreement with regard to the south traffic. We also have a small traffic arrangement with regard to Dumfries, but not of a sufficiently extended character.

17,626. (*Chairman.*) Can you make any suggestion with regard to facilitating the interchange of traffic between neighbouring companies?—I think, perhaps, if Parliament would give railway companies rather more extended powers to make agreements, which would be of a legal character, we might. The danger is in making agreements between two companies which are ultimately held to be *ultra vires* of their powers, and this very frequently prevents it being done. There was a very large arrangement of that kind in Scotland between the Caledonian, the Edinburgh and Glasgow, and the Scottish Central, which was suddenly put an end to.

17,627. By one of the parties who did not find it to their advantage?—Yes, they began to have other interests.

17,628. On the whole, do you think a better understanding exists at present among neighbouring companies than was formerly the case?—I think decidedly.

17,629. And the tendency on the part of the railway companies is to give facilities to each other?—Quite so. I scarcely know an instance now in which there are not through booking and similar facilities between neighbouring companies.

17,630. Impediments are not purposely offered now in the way of an interchange of traffic or through booking?—Certainly not; we all of us in our district endeavour to run our trains so that they shall fit into each other at the various points of junction. We give through booking to all places where there is any necessity for it. We cannot have through booking to all stations because the ticket office would not contain the tickets, but still, whenever there is any demand we give through booking arrangements.

The witness withdrew.

Adjourned till Thursday, the 31st inst., at 12 o'clock.

Thursday, 31st May 1866.

PRESENT:

THE RIGHT HON. THE EARL OF BELMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
SIR ROWLAND HILL, K.C.B., F.R.S.
T. B. HORSFALL, ESQ., M.P.
GEO. CARR GLYN, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., F.R.S.
E. T. HAMILTON, ESQ., M.P.
WILLIAM POLE, F.R.S., *Secretary*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

MR. CHARLES HUTTON GREGORY examined.

Mr. C. H. Gregory.
31 May 1866.

17,631. (*Chairman.*) I believe you are a civil engineer, and one of the Vice-Presidents of the Institution of Civil Engineers?—I am.

17,632. You have for upwards of ten years acted as arbitrator for the Post Office in cases for fixing rates of payment to railway companies?—I have.

17,633. (*Sir R. Hill.*) Have you, in your capacity of arbitrator for the Post Office, had occasion to consider the cost of working trains and the charges made by railway companies to the public?—Yes.

17,634. Do you consider there are circumstances which cause great difference in the items constituting the cost of working trains?—I think there are. The elements of the difference of expense are of a very various nature. In the first place, while the railway is new, or while the rolling stock is new, the actual outlay in maintaining the rolling stock and the railway does not represent the amount of expense which will be incurred when the stock and the lines arrive at an average condition. Then again, the character of the permanent way or of the engines may affect their expenses. The gradients and curves and loads will also be a cause of difference; while there are certain elements of expense which are constant, whatever the amount of traffic may be, and there are others which vary in proportion to the amount of duty done.

17,635. From what sources have you ascertained the cost of running trains?—It has generally been my object, in acting as arbitrator on behalf of the Postmaster-General to ascertain, where necessary, as nearly as I could the actual cost of the trains of the railway under consideration, as a basis for ascertaining what the cost of a mail train would be; and similarly, in dealing with payments, I have considered that the earnings of that particular railway would be a guide as to what the earnings of a mail train ought to be. But with reference to the answers I am now about to give before the Commission, with regard both to expenses and earnings, I have directed my attention to the last return from railway companies which was presented to Parliament, showing the expenses and earnings of all the railways in the United Kingdom.

17,636. For what year was that?—That return was ordered by the House of Commons to be printed on the 4th July 1865. It has reference to railway expenses and earnings in the year 1864.

17,637. Will you give the results of the last investigation which you have made?—I will first deal with the question of expense. I find from summaries giving the per-centages of the different items of expense the average results in the table which I now hand in:—

	Per mile. *d.*
Maintenance and renewal of way and works	5·619
Locomotive power	8·388
Maintenance and renewal of carriages and waggons	2·658
Traffic charges	8·526
Rates and taxes	1·188
Government duty	·807
Compensations for injury to persons	·258
Do. to goods	·219
Legal and Parliamentary expenses	·420
Miscellaneous charges	1·917
	30·000

It will be seen from the return that the average cost of all trains, including both passenger and goods trains, was about 29¾*d.*, but for convenience in division I take it as 30*d.*, or 2*s.* 6*d.* per mile. I believe that this rate has been for some years the accepted average rate among railway engineers and railway officers.

17,638. At what results have you arrived in dividing the details of the receipts?—Dividing the total receipts from passenger trains by the total mileage of passenger trains in the United Kingdom, I find this result, that the earnings have been on the average 56·56*d.* per mile. This amount is rather less than the usual rough estimate of 5*s.* per mile, which I believe has been considered to be the average earnings of a passenger train. The average earnings per mile of the goods trains appear, from the returns which I have named, to be about 70·31*d.* per mile, or nearly 25 per cent. more than the average earnings from passenger trains.

17,639. You have referred to the average expense attending the working of trains, can you separate the cost of goods and mineral trains from that of passenger trains?—I have no means of making such a separation as would give correctly an average result; but I have no doubt that it will be found that in most respects the cost of goods trains is very much greater than the cost of passenger trains.

17,640. Will you refer to some of the items of cost which differ in goods trains and in passenger trains respectively?—I believe that the injury to permanent way caused by the running of goods trains is very much greater than the injury which is caused by the running of passenger trains. In the first place, the engines themselves are generally heavier and the large weight upon the driving wheels is one of the elements of a destructive nature affecting the permanent way.

17,641. (*Capt. Galton.*) Is it the case that the weight upon each of the driving wheels of the engine of a goods train is heavier that on those of the engine of a passenger train?—If you take the total weight on the driving wheels I think you will find the weight very much greater.

17,642. I refer to the weight on any individual wheel which will be the means of injury to the permanent way?—I do not think that is the sole measure of injury to the permanent way done by the whole train. I believe it will be found, generally speaking, that the weight on the driving wheels is not only greater as regards the total in goods engines, but also as regards the individual driving wheels. There no doubt are exceptions in which you have a very great excess of weight on one pair of wheels of a passenger engine, but the system that has lately obtained on many railways has been to have passenger train engines with two pair of driving wheels coupled, in order to obtain additional adhesion and to diminish the total amount of weight which would be on any one pair of driving wheels of a passenger engine. Of course you are aware that with goods engines all six wheels are generally coupled, by which means a greater total weight is obtained upon the driving wheels, while the weight on the wheels of the rest of the rolling stock is very much less than the weight on the driving wheels. I believe from my own observation that the running of the waggon stock of mineral and goods trains does a very large amount of injury to the permanent way, not so much in the actual crushing effect arising from the weight upon the wheels as from the extremely

Mr. C. H. Gregory.

31 May 1866.

irregular action of the wheels arising from the inferior nature of the waggon stock, from their not being coupled up, and from the waggons not being kept up as passenger carriages are. Anybody who observes the running of goods trains will see that the waggons are moving about in such a way that the lateral blows must be highly destructive to the permanent way, and very likely to derange the fittings of the permanent way. The next item to consider is the question of the locomotive expenses. While I am not prepared to state exactly what the average additional cost of locomotive power for goods trains is as compared with passenger trains, I have heard it variously estimated at from 25 per cent. to 100 per cent., and it is also clear that the traffic charges connected with goods trains must be very much higher than those connected with passenger trains. The staff of clerks, inspectors, porters, and other railway officials, necessary for carrying on the goods traffic is enormously in excess of what is necessary for carrying on passenger traffic. If a person went first to Euston Square and saw the staff of clerks and porters engaged in the passenger station there, and then went on to Camden Town and saw the staff of clerks and porters engaged in the goods station, he would see the great excess in the goods department.

17,643. (*Sir R. Hill.*) What general inference do you draw from the differences to which you refer?—That on the whole the cost of conveying passenger trains is very considerably less than the cost of conveying goods trains, and that such is the case whether you include the general expenses or whether you are dealing with the question of bare additional cost.

17,644. Would all the items of cost which appear in the table to which you have referred form part of the actual additional cost to the company of running an additional passenger train, say, a light mail train?—Certainly not. In running an additional passenger train of the ordinary description there are many of the items in the table which I have handed in which would not necessarily be at all increased, and still more so as regards a light mail train, in which the use of the railway staff is even less than with a passenger train.

17,645. Take, for instance, a special mail train consisting of an engine and two vehicles, say, a post-office carriage and a break van, and see how the results of the return would apply to such a train?—The running of any additional train would affect the permanent way, but it would not affect the permanent way to a proportionate amount. There are a certain number of the items of the expense of maintaining the way which are constant, and others which are nearly so, and very little affected by the running of a train. For instance, the fencing, the earthwork, most of the bridges, drains, roads, and station buildings are either obviously affected not at all by the running of trains or affected only very little. Some bridges are affected, of course, more than others. Timber bridges and some iron bridges may be affected by the running of trains. Stations and station buildings would to a very small extent be affected in their maintenance by the running of trains, inasmuch as the running of trains would involve the wearing out of floors, and so forth. But still those items that I have named are practically hardly affected at all by the running of the trains. Again, the ballasting is not actually affected in proportion to the number of trains run; the packing of the ballast would probably be proportionate to the number and weight of trains. There is an amount of ballast lost by means of grinding and wear, but a very considerable quantity of ballast is lost by wind and by water. The sleepers are affected partly by wear and partly by decay. Approximately, I should say, that the wear of the rails is proportionate to the number of trains; but a correction, even here, will have to be applied for light trains or heavy trains, for light engines or heavy engines. I see that I have omitted to refer to station yards, and the accessories in station yards, such as turntables, switches, and sidings, to which it is obvious that the amount of injury done by passenger trains would be less than the amount of injury done by goods trains on account of the smaller use of these accessories by passenger trains. The amount of injury done would be still less, when we are considering a light mail train.

17,646. (*Capt. Galton.*) As a broad rule, do you not find that the maintenance of way varies in a direct proportion to the amount of traffic?—I cannot say as a matter of fact. As a matter of figures I think you will find that it has, but for this reason, that with the increase of railway traffic and the increase of mileage on the railways of the country generally there has been a great increase in the cost of the permanent way, arising from causes which were not introduced into the earlier accounts. The expense of reproduction is not an element in the accounts of a perfectly new railway; so that while a large mileage may, bring out in figures a mileage cost for maintenance of way as great as when the mileage was small, I think this result has arisen from the introduction of that element, which at the beginning of the running of any particular railway did not exist.

17,647. (*Sir R. Hill.*) What sum in your opinion would represent the cost per train mile of maintenance and renewal of the permanent way?—I feel that any figure which I can name will be merely an estimate; but I remember some years ago the matter was very carefully investigated, and a conclusion was come to that upon the average of trains, the actual injury to permanent way by the running of trains, including goods and passengers, amounted to 2*d.* per train mile, but then the cost of maintenance was considered only to be about 4½*d.* Now the introduction of the element of reproduction has raised the average cost of maintenance, and I should be disposed to add another 2*d.* to make up that reproduction, and so should assume, which I admit is only an assumption, but I think not a very unfair one, that the actual injury done to the permanent way by the running of an average train would be about 4*d.* per mile. If you come to apply this to a passenger train I believe that the result will be diminished, and still more if applied to such a light train as that to which my answers are now directed. I think that for such a train, that is to say, consisting of one engine with two vehicles, 3*d.* per mile would amply represent the actual injury done to the permanent way.

17,648. (*Mr. Glyn.*) In estimating the cost of goods trains, have you allowed for the difference of speed between the goods trains and the passenger trains?—Yes.

17,649. What do you allow for that?—Are you alluding now to the question of maintenance of way?

17,650. You said, generally and broadly, that the expense of goods trains as regards the company itself was higher than that of passenger trains?—Yes.

17,651. But you did not state whether in that you made any allowance on the other side for the less injury done to the permanent way by the slower speed of the goods trains?—I was speaking of the general result.

17,652. You did include that as part of your calculation?—Certainly.

17,653. (*Sir R. Hill.*) Will you now have the kindness to direct your attention to the question of the cost of locomotive power?—I have already observed that the cost of goods trains is generally greater than that of passenger trains. In considering the cost of locomotive power I assume a difference of 25 per cent. I am not able to say whether that is perfectly correct, or whether that would be the real average if we could get returns from all the railways of the kingdom: but I think it is a fair approximation. Taking the sum of 8·388*d.*, which appears in the Table I have handed in, as being the average cost for locomotive power for all the trains in the United Kingdom, and making a correction which should bring the proportion of the cost of goods train engines to 25 per cent. more than the cost of passenger trains engines, the result gives a little less than 7½*d.* as the cost of locomotive power for an average passenger train. It

will be seen in the summary of the return in the Parliamentary paper to which I have alluded, that the mileage of passenger and goods trains is tolerably close, but there is a slight difference, and in making the reduction I have taken that difference into account, and $7\frac{1}{2}d.$ is the result as showing what I estimate as the average cost of locomotive power per train mile for passenger trains.

17,654. It may be a question whether for the present purpose the interest on the cost of the engines should be added; if it were, what would be the result?—Taking the average cost of an engine to be 2,500*l.*, and assuming its yearly duty to be 20,000 miles, interest at 5 per cent. would work out at $1\frac{1}{2}d.$ per mile, and if that be added to $7\frac{1}{2}d.$ it would make the total cost of locomotive power for a passenger engine $9d.$ per mile.

17,655. You have now given your calculation of the cost of locomotive power for an ordinary passenger train; would the cost of locomotive power for a small mail train be as great?—Not necessarily so, for a smaller engine might perform the duty, and the power required would obviously be less for so light a train than for an ordinary passenger train; but I think it is safer to retain the amount which I have named for the following reasons, that it would avoid the necessity of having a special stock of engines for mail purposes, and it would make some allowance for the speed at which mail trains are frequently required to run.

17,656. Can you give an estimate of the cost to the company of the maintenance of a carriage or van?—The Clearing House rate for break vans and carriages of that description is $\frac{1}{2}d.$ per mile. That rate is universally known to be a rate far in excess of the actual cost of keeping up the stock, and I believe is intended to be a rate greater than the real cost, in order to prevent Railway Companies from keeping foreign carriages on their line. It is generally my custom in Post Office arbitrations to take that rate of $\frac{1}{2}d.$ per mile in order to make an allowance which should be quite upon the safe side, and liberal to the Railway Companies.

17,657. For two vans that of course would amount to $1d.$ per mile?—Yes, which I think would be more than enough; it would cover interest and maintenance and every other item of expense in connexion with the carriage.

17,658. Would not some of the remaining items of the general average require modification, or entire suppression in estimating the additional cost of such a train as you have named?—Clearly. To begin with, the Government duty cannot apply to a mail train, nor compensation for injury to goods, and I think neither legal nor Parliamentary expenses. Excluding those, the remaining items with which I have not yet dealt are the traffic charges, amounting to $8{\cdot}526d.$; Rates and Taxes amounting to $1{\cdot}188d.$; Compensation for Injury to Passengers $0{\cdot}258d.$; and Miscellaneous charges $1{\cdot}917d.$; making a total of $11{\cdot}889d.$

17,659. Have you anything to say upon the subject of rates and taxes?—I presume that the taxes would not be very much affected by the earnings; but the rates I believe are, and I think it is generally accepted that the value of a railway, in other words its earnings, are the proper basis on which the parochial rates should be assessed. Therefore I think I should not be wrong in saying that the rates may be estimated in direct proportion to the earnings. I therefore take the sum of $1{\cdot}188d.$, and I assume without any precise reason, for I have no exact data to show for it, that seven-eighths of a penny would represent the fluctuating amount included in that item. Supposing that an average passenger train consisted of seven vehicles, the amount assignable to each vehicle would be one-eighth of a penny, and therefore the rates for the two vehicles to which you have alluded, would amount to a farthing per mile; that result being based on the assumption that the earnings of those vehicles are the same as the earnings of the vehicles in an ordinary passenger train.

17,660. Do you consider insurance against accidents an item which ought to be added to the cost of a mail train?—I think it ought, and for that reason I should put down say, a farthing, and strike out the third figure in the decimals in the table I have given. I do not think the risk is quite so great, because there are not so many passengers in the exclusive train to which you have alluded, but if a mail servant is injured he may be rather more injured than an ordinary passenger would be; he may be thrown from one end of the carriage to the other. I think, therefore, on the whole, it is safe to put down a farthing.

17,661. Do you take into account in estimating it at a farthing the circumstance that the mail train may be the cause of accident to another train?—Yes; that was one consideration which led me to put down so large an amount.

17,662. Now as to the traffic and miscellaneous charges, what do they consist of; how far would they apply in this case?—They consist of the general expenses of administration to begin with, the manager's office, the secretary's office, and the accountant's office. It seems to me that not a single extra clerk, or a proportion of a clerk, could be required in order to meet the actual expense to the Company of running an additional train for postal purposes. While voluminous accounts have to be kept with regard to the Companies' general business, when once the rate for a mail train is fixed it involves no accounts, and scarcely any correspondence. So that I cannot see how there can be any expenses in the head administration, or in the accountant's office. The remainder of the charges are the traffic charges, and those traffic charges are made up of superintendents, porters, police, clerks, &c. I do not see how any of those can be affected by the running of an additional mail train—not necessarily, although there may be cases in which they are affected. There is one element of expense which clearly is attached to the running of a mail train, and that is the expense of a guard. I assume the payment of a guard at $5s.$ per day, and that he runs the low average of 120 miles a day, and that produces a result of a halfpenny per mile.

17,663. You have not made any allowance for special items of cost where a special staff is necessary?—In the estimate I have just given I have not, but it appears to me that in most cases those expenses can be very readily ascertained. It has been my invariable habit in Post Office arbitrations to endeavour to ascertain whether there is any actual addition to the staff arising from the running of a mail train, and to make an allowance for it. Night service, when there are no goods trains running, sometimes requires a special addition. Again, on those railways in Scotland where there is no ordinary passenger traffic on Sundays, it is clearly right that the expense of keeping up the necessary establishment on Sunday, such as gate-keepers, signalmen, police, and others, should be taken into account.

17,664. Will you recapitulate the items of the cost of a light mail train, and give the result?—The items that I have examined are as follows:—Permanent way $3d.$, locomotive power $9d.$, two vans $1d.$, rates and taxes $\frac{1}{4}d.$, injury to passengers $\frac{1}{4}d.$, guard $\frac{1}{2}d.$, making a total of $14d.$

17,665. What is your estimate of the cost of other carriages added to such a train as you have named?—About $1d.$ per carriage, or a trifle more. It may be a trifle under, but I would set down $1\frac{1}{2}d.$ in order to be on the safe side so as to include every possible expense; that sum including locomotive power, injury to road, and every expense which would be incidental to the addition of those carriages.

17,666. Apply this to a train of, say seven vehicles in all?—Five additional vehicles would make it amount to $7\frac{1}{2}d.$, and that added to the amount which I have previously given would bring up the total additional bare cost of the running of a mail train of seven vehicles to $1s.\ 9\frac{1}{2}d.$

17,667. Do you think this estimate is a fair and full one of the actual cost to the company of running

Mr. C. H. Gregory.
31 May 1866.

an additional train?—I think it is. The Commission will perhaps recollect the estimate of the late Mr. Robert Stephenson which was made in 1856 for railway purposes when he was endeavouring to point out that by moderate fares a large amount of profit might be brought to Railway Companies. The words he used were: "The cost of running a train may "be assumed in most cases to be about 1*s.* 3*d.*" Of course I do not know what items he included in that cost, but from the context I supposed that it meant the actual bare cost to the Railway Company. My estimate, as you will see, is very much higher.

17,668. In the event of the Post Office requiring an exclusive train, should not the additional cost to the Company of running such a train form the basis on which payment for the service should be estimated?—That has generally been the basis which I have adopted in arbitrations between Railway Companies and the Post Office, believing it to be a fair basis, and considering that the cost of an exclusive train, with a proper amount of profit added, would give the maximum cost to which any mail train should be subject.

17,669. That is to say, you are of opinion that the Post Office should not pay so much for the partial use of a train as for the exclusive use of a train?—I think they should not; I cannot see on what ground it can fairly be urged that they should.

17,670. Are you prepared to say what addition to the bare cost to the Company should be allowed for profit, including under that term "interest of capital, "&c.?"—I have been in the habit of proposing to umpires that an addition of 100 per cent. should be made to the bare cost.

17,671. You would probably think it fair that the profit should bear the same ratio to the expenses as is customary when a service of a wholesale and continuous character is performed for the public?—I think so. The view which I have taken and endeavoured to urge upon umpires, believing it to be just, in arbitrations between the Post Office and Railway Companies has been this: the Postmaster-General is obliged to make use of a particular railway; it is in comparatively few cases that he has the benefit of competition at all, and I endeavour to consider what the charge would be that the Railway Company might make in fairness to itself for particular services. According to that view I think that the principle on which I have proposed rates of payment has not been an unfair one. I do not think if a railway company were considering what they would charge for additional traffic that they might have or might not have, according to the rates they charged, that they would endeavour to make that additional traffic pay part of the general expense of the other traffic by calculating in their own estimate the cost of general expenses which are not really affected by the running of a particular train, and I have heard railway officials say that when they were calculating what the actual cost of a train would be for their own purpose they assume a considerably less amount than that which I have here put before the Commission as the bare cost.

17,672. You are no doubt aware that the law officers of the Crown have repeatedly affirmed that mail trains are legally exempt from toll or other charges for the use of the road?—I have heard that; it was brought under my notice when I first began to act as arbitrator for the Post Office.

17,673. As arbitrator for the Post Office do you ever claim such an exemption?—I never have. I believe I have alluded to it as a claim which might be raised, but I have never claimed it myself.

17,674. (*Capt. Galton.*) If you consider you have a legal right to claim it, why have you not claimed it?—I did not mean to say that I considered I had a legal right to claim it. The opinion to which Sir Rowland Hill has alluded was mentioned to me when I was first asked to act as arbitrator for the Post Office, but I was told at the time that the Postmaster-General did not desire in any way to influence my judgment as to the rates that I proposed in dealing with Railway Companies. I was not desired to press that point, and my own judgment being that that point ought not to be pressed, I never have pressed it.

17,675. (*Earl of Belmore.*) Would it not necessarily happen, if that point were to be pressed, that the Post Office would have to find the vans and engines if they were to run free of toll over the lines?—Yes, the practical result might be that, or the alternative would be that the Company would have to run without profit as regards the road.

17,676. What I mean is this, although the Post Office assert that they have a right to use the railroad without paying tolls, they do not mean to say that they have a right to use the engines and carriages of the Company free of charge?—No.

17,677. Therefore, if they do not make an arrangement with the companies for the use of their rolling stock, and claim to use the lines free of toll, they would have to find their own rolling stock?—Yes. I remember at one time that was in the serious contemplation of the Post Office. They tried to get power to run their own trains on the railways, in order that they might have an engine of an inexpensive character, so that they might keep down the expense attending the running of trains. In most of the Railway Acts the toll for the use of the road is kept separate from the charge for the use of engines and carriages, so that, in point of fact, if the assumed legal right to run without paying toll were enforced and allowed, it would simply then come to paying for use of engines and carriages.

17,678. (*Mr. Glyn.*) Practically, whether that is a legal claim or not, the Post Office have not pressed it?—They never have through me, and I do not know that they have pressed it through anybody else.

17,679. (*Sir R. Hill.*) The payment by the Post Office for an exclusive train, consisting, say, of an engine, a break van, and a Post Office carriage, would then, in accordance with these views, be, under ordinary circumstances, 1*s.* 2*d.* plus the ordinary profit?—Yes.

17,680. If the mail train is not exclusively devoted to the Post Office service, you would, I presume, be of opinion that the payment should be less than that of an exclusive train?—I think so.

17,681. The reduction from the maximum charge being determined, I presume, with reference to the use the Company might make of such train?—Yes; and having reference also to the earnings of the mail train as compared with those of other trains.

17,682. The evidence you have given applies only to mail trains established on the requirement of the Postmaster-General, or, as they are technically called, trains under notice. Is not that so?—Yes.

17,683. But does not the Post Office frequently use the ordinary trains, namely, those run by the Companies at their own hours, for their own purposes?—Yes.

17,684. Can you suggest to the Commission any fair mode for determining payment by the Post Office for this latter description of service?—It seems to me that the fairest plan is to endeavour to ascertain the charges which are made by the Railway Companies to the public in their passenger trains, for services analagous to those required by the Post Office. There are no services which are precisely identical, and some correction would be required, however close an approximation might be got.

17,685. What are the mail services usually required as regards ordinary trains?—The mail services are of two characters: first, the service which involves the use of a certain number of vehicles, or parts of vehicles, in which the Post Office servants take charge of the dead weight; and the other service, and the more frequent one in ordinary trains not under notice, is where a number of mail bags are carried in charge of railway servants.

17,686. Can you give the Commission any idea of what the public pay for the use of a passenger carriage on the average?—I have before stated the average earnings of a passenger train in the United Kingdom

at 56·56*d.* What the public at large pay for the use of a railway carriage is what each carriage earns, and assuming that the number of vehicles in a passenger train were seven, which I think is about fair, the result produced would be an earning of about 8*d.* per mile per carriage. If the average number of vehicles is taken at six it will give an average earning per vehicle of a little less than 9½*d.* per mile. I do not name seven as a number which is arrived at by any certain calculation, or by returns which I can put before the Commission, but I think it is very near the truth. It is a subject upon which there is a considerable difference of opinion. I heard one railway manager of great experience within the last two or three days estimate the average number at ten vehicles throughout the whole of the United Kingdom, and I heard another say he thought it did not exceed six vehicles of every description. I have not heard anyone set the average at less than six. I make a clear distinction in the answers I have just given between what the Companies really charge the public for the use of a carriage and what they might charge if that carriage were full of passengers. I have found that arbitrators acting on behalf of Railway Companies have not unfrequently set up a claim for the use of the mail carriage running in a passenger train, whether it be a van or a portion of a second-class carriage doing van duty, as portions of second-class carriages very often do for parcels and luggage, on the assumption that the compartment or the carriage was entirely full of passengers paying the full rates at single fares. I consider that is not a fair basis of calculation, because it would be in fact making the Post Office pay more than the public really do pay for the use of a carriage or of a compartment.

17,687. Assuming seven to be the average number of carriages in a train the payment by the public amounts to what sum per mile?—8·08*d.*

17,688. Assuming mails to be conveyed by passenger trains, can you not find some analogous service in passenger trains which is performed for the public?—I look upon the mail service as, to a great extent a van service. There is a somewhat analogous service which is performed by most passenger trains that is generally excluded from express trains, I mean the conveyance of horses and private carriages.

17,689. Would the comparison of the mail van service with the use of horse-boxes and carriage-trucks be exactly analogous?—Not exactly; corrections would be required both ways. A carriage-truck or a horse-box costs less than a mail van or a second-class carriage, a portion of which may be doing duty for mail service. But then there is a continuity of service in the mail duties, and to a large extent a regular return duty, while the use of carriage-trucks and horse-boxes involves a large amount of stock standing idle, whereas the stock employed for the running of mails is a stock which has a regular use for that particular purpose. Horse-boxes and carriage-trucks may sometimes have to run empty in order to restore the balance at the different stations. Then, again, a large amount of compensation may have to be paid for injury done to a carriage or horse, and I believe it is the fact that compensation has never been asked for injury or loss of mail bags. On the other hand, seeing that horse-boxes and carriage-trucks are rarely carried by express trains, some slight addition might be considered necessary in order to pay for extra speed. Assuming that an analogous service was rendered to the public, I think that the increase for speed would be more than balanced by the reduction which the Company would naturally make to any large customer for regular continuous service which was not only regular in one direction but regular in both directions.

17,690. What is the profitable load carried by the vehicles you have named?—A horse-box on the average carries considerably less than two horses, some fraction between one and two horses, and a carriage-truck is often run with a two-wheeled vehicle, for which the charge on many railways is smaller than for a four-wheeled vehicle; I therefore take a charge above the average, in taking the charge for two horses; and I take the charge for a four-wheeled carriage, and in taking those two charges I clearly take an amount which is above the average, which the Railway Companies charge to the public for the use of those vehicles.

17,691. Have you worked out the results which those charges would give?—I have worked out the results several times, and I took a number of averages within the last few days. The last averages which I have taken out show a result of about 5·8*d.* per mile for the use of a horse-box, and 5·2*d.* for the use of a carriage-truck.

17,692. Are these the full rates paid?—Not always. Supposing a private carriage is loaded with luggage, an extra rate is charged, which very often is set down at 50 per cent. If that were added to the rate I have named it would bring up the total charge for a carriage-truck containing a private carriage loaded with luggage to 7·8*d.* per mile. A reduction is made upon that rate for commercial travellers.

17,693. A groom sometimes travels with a horse, is any charge made in such cases?—Grooms travelling with horses are charged third-class fare, say 1*d.* per mile, and if two grooms travelled that would bring the charge for a horse-box to 7·8*d.* per mile, the result in either case showing an average of less than 8*d.* for each vehicle with its load. I stated before that that amount would not include any deduction whatever for continuity of service, return work, and extent of custom, nor any increase for higher speeds.

17,694. Will you now apply these charges to the determination of what a company may be considered as earning by the use of a single compartment of a carriage?—I think that on the whole the elements of difference to which I have alluded are rather in favour of the mail van, and that a small reduction ought to be made. I think 7*d.* or certainly not more than 8*d.* per mile would be a very fair charge to the Post Office for the whole of a carriage. Then, in order to arrive at a rate which would be applicable to a compartment, you must take the proportion which the compartment bears to the whole carriage, that proportion being in some cases three and a half in a second-class carriage and in some cases four; therefore, I think about 2*d.* per compartment per mile is a very fair charge for the use of that compartment for mail purposes.

17,695. That being according to your view the sum earned for the Railway Company by that compartment?—Yes.

17,696. How far is the carriage of mail bags in charge of the railway guard analogous to the carriage of ordinary parcels?—It differs from the carriage of ordinary parcels in several ways. With ordinary parcels there is no continuity or regularity of service. The parcels bear in all cases terminal charges; charges of booking, collection, delivery, and handling, and under no circumstances are those charges entirely abstracted from the charges upon parcels; therefore, to begin with, in ascertaining parcel rates, which at all apply to the carriage of mail bags, you must take long distances, so that these terminal charges, although they may not disappear, will bear a comparatively small proportion to the whole charge. Then, again, the loss of or injury to ordinary parcels may involve a large amount of compensation, and, as I stated before, I am not aware that there ever has been a case, indeed I am positively told so at the Post Office, in which payment was ever made for the loss of bags however valuable. The Inspector General of Mails confirms me in that statement.

17,697. You consider, then, that the ordinary parcel rates are for a more expensive service than the carriage of mail bags?—Certainly, because the carriage of parcels involves expenses to which mail bags are not subject.

17,698. How would you arrive at parcel rates which would be analagous to the carriage of mail bags?—By taking rates of parcels conveyed long distances, and making some reduction for the regularity and continuity of service, and for the large

Mr. C. H. Gregory.

31 May 1866.

amount of business. The Railway Companies themselves make reductions in many cases for regularity and continuity of service and the omission of collection nad delivery. For instance, newspaper parcels are charged by most railways at about half the rate of ordinary parcels. That is a very general proportion. Then again, a commercial traveller's luggage is charged at a very reduced rate. I have at several times taken out haphazard from the published charges of different Railway Companies what the parcels rates are, and when you arrive at a certain distance which varies from 70 to 200 miles or more, you find that the charge for parcels arrives at a sum of about one halfpenny per cwt. per mile, and applying the reduction which I have named for newspaper parcels, brings out a result of a farthing per cwt. per mile.

17,699. Are these rates subject to reduction when large quantities of parcels are carried ?—Yes ; I find that with commercial travellers' luggage a very frequent rate of charge is 6*d.* per mile for the first 30 cwt. which is one-fifth of a penny per cwt. per mile. This is for luggage taken in the gross and dealt with in the mass, not dealt with by the cwt., but it is a service by passenger trains, and for each additional ton after 30 cwt. the charge is 3*d.* per mile, which is at the rate of less than one-seventh of a penny per cwt. per mile. In some cases 6*d.* is charged for the use of a whole truck loaded with luggage, not more than 50 cwt. being carried, in one truck. Supposing 50 cwt. to be carried, the rate produced is one-eighth of a penny per cwt. per mile. The rate which I have been in the habit of proposing in Post Office arbitrations for the carriage of bags by ordinary trains not under notice is one halfpenny per cwt. per mile, being in fact very much more than I think the Post Office might claim that the bags should be carried at.

17,700. I think it is one halfpenny per cwt., or the fraction of a cwt., is it not ?—Yes ; and I have always taken the weight at a period of the journey when the bags are heaviest.

17,701. The halfpenny per cwt. per mile is reckoned on the maximum weight of the bags ?—Yes, and upon the total distance travelled ; for instance, supposing the quantity of mail bags carried by a particular train is four cwt. at starting, and before it has got to a quarter of the distance some bags are dropped, and then when it gets on further other bags are dropped, and by the time it reaches the end of the journey the total weight of bags is only two cwt., I still allow for 4 cwt. for the whole distance.

17,702. It has been stated in evidence that the Railway Companies carry the Post Office parcels for nothing ; can you confirm that statement ?—Oh, no ; it is utterly groundless ; at least as far as those rates are concerned which have been determined in arbitrations with which I have had anything to do. I never consider the contents of the bags ; I only know that there are certain bags of a certain weight ; I get returns from the Post Office of the details of the service, which are always very fully supplied to me. Those returns give the weight of the bags. I do not know whether they contain newspapers, or book parcels, or letters, and in my statements to the umpires I only give the total weight, where we are dealing with a service which is a mail-bag service of the sort you are alluding to. I do not always go into the question of weight, for when the Post Office has the use of a whole van, whether they put little or much into it, does not affect the Company. I do not think it would be fair to base the charge on a very small amount of weight, which might still involve the use of a van or a compartment of a carriage.

17,703. When acting as arbitrator for the Post Office did you ever object to Post Office parcels being considered as part of the mail ?—Never. I should have thought it would have been a most absurd objection for me to make.

17,704. I think you have already stated that you usually supply the other arbitrator (and the umpire, where there is one,) with a statement of the weight of the mail ?—I give it to the umpire and to the other arbitrator when he likes to have it.

17,705. And your statement of the total weight includes the parcels ?—It includes parcels and every thing that is in the mail bags, and the bags themselves.

17,706. Do you ever attempt to separate letters from parcels in your statement ?—I never have the means of doing so, and I have never been asked to do so.

17,707. Could the umpire then, even if so inclined, make an award which should exclude payment for parcels ?—I do not see how it would be possible for him to do so ; it was a perfectly new idea to me till you put the question.

17,708. (*Mr. Glyn.*) Parcels would, in fact, be included in the general weight ?—Yes, and paid for to the Company at a higher rate than they charge for their ordinary parcels. Perhaps you will tell me with regard to what railway that statement was made ?

17,709. (*Chairman.*) It was made with reference to the North-eastern Railway ?—I was the arbitrator for the Post Office in the last two arbitrations with the North-eastern Railway, and I am quite certain I never attempted to exclude payment for parcels. I may add that in both cases a very full award was made. The statement is entirely incorrect ; I am sure unintentionally.

17,710. (*Mr. Glyn.*) Do you recollect who was the referee ?—There have been two arbitrations with the North-eastern in which I was the Post Office arbitrator. In the first with which I had to do the referee was Sir William Cubitt, and in the last the referee was Mr. Stuart Wortley.

17,711. (*Mr. Horsfall.*) I suppose the arbitrations are conducted in the usual manner, the Railway Company nominates one arbitrator and the Post Office the other, and those two agree to appoint a referee ?—Yes ; the law prescribes that mode of dealing with an arbitration. There are no instructions as to the principle on which an arbitration is to be conducted. It is left entirely in the breast of the arbitrators. The arbitrators are bound before they enter upon their duties to agree upon an umpire, and the Act of Parliament simply prescribes that the arbitrators and their umpire shall award, I think the expression is, "a reasonable rate of remuneration." The usual course is this—it is not the invariable course, but it is the usual course—before getting their formal appointment the two arbitrators meet and try to agree, having previously privately agreed in honour who the umpire shall be. If they find they can agree, they do not go to the umpire ; they simply get an appointment and make their award. If they find they cannot agree, they obtain their formal appointments, and appoint their umpire, and after each having obtained from the other such information as they may desire, they each make out a written statement, and exchange those written statements, and send copies of those written statements to the umpire. They then within some agreed period exchange replies, and send copies of those replies to the umpire, and generally speaking it is left to the umpire to decide whether he will have the arbitrators before him or not.*

17,712. (*Mr. Glyn.*) I think there are many cases now in which the two arbitrators settle between themselves without going to the umpire ?—I am sorry to say not so often as I should like.

17,713. But the arbitrators frequently do that nevertheless, do they not ?—Not very often.

17,714. What class are the umpires generally taken from ; they are all men of eminence in some way or other, are they not ?—We always endeavour to get persons of the highest respectability, and most of them are men of eminence. My desire always is if possible to get somebody who understands railway working, but I frequently find a great objection to that on the

* In some cases the arbitrators only make verbal statements to the umpire, and in some cases the umpire and arbitrators sit as a court, and witnesses are examined by counsel.

part of the Railway arbitrators, who rather prefer somebody who does not understand railway working. We have been very fortunate in the character of our arbitrators, and the distinguished position of many of them, and the great attention which gentlemen of such distinguished position give to their duties.

17,715. Can you furnish a list of the umpires who have acted for the two sides, wherever you have been called in?—I have not a list here, but I will forward one. The arbitrators are generally railway managers or engineers. In the last reference I had, Mr. Harrison was the Railway Company's arbitrator, and our umpire was Mr. Hawkshaw.

17,716. (*Capt. Galton.*) What sort of award did you get in that case?—I thought it too high, but I have no doubt Mr. Harrison thought it too low. For a long time I have had very few arbitrations for the Post Office, and the negotiations have been carried on I think generally by the Inspector-General of Mails with the railway officials.

17,717. (*Mr. Glyn.*) Is it not the fact that a certain number of general principles have been laid down which make it much more easy to come to a settlement than formerly?—I cannot say that, because the arbitrators on behalf of the Railway Companies invariably dispute my principles, and I cannot admit their principles. The principle on which the Railway Companies generally go is this, that if the Postmaster-General requires trains they must be paid for as exclusively special trains, and when such a claim is made I invariably ask for the earnings of the mail trains, and if I find that the mail train is an exceedingly good one as regards its returns, compared with other trains, I repudiate its being paid for as a special train.

17,718. I suppose the principles of the decisions of the umpires are never arrived at?—I cannot say what their principles are, for the umpires of whom I have made inquiries almost invariably refuse to give me any explanation of the principles on which they make their award.

17,719. (*Mr. Horsfall.*) The award would be illegal if they did, would it not?—Not necessarily so. It might be made a ground for setting aside their award, and therefore they very properly refuse it, but, nevertheless, I try to get it sometimes, not for the purpose of invalidating the award, but for my private information.

17,720. (*Chairman.*) I will read to you the evidence which has been given with respect to the North-eastern which has been referred to, and I should like to have your opinion upon the statement of the General Manager. "The Post Office have taken "from us our parcel traffic under powers acquired "distinctly for no other purpose than the carriage of "letters. We are quite ready to do anything that "may be wanted for the letters, but we feel it very "hard that those powers should be, as we think, "abused for the purpose of transferring the receipts "of a large parcel traffic to the profit of the Post "Office, that is to say, of the country generally, and "taken from the Railway Company, the Railway Com-"pany being at all the trouble and expense."

Then he is asked—"If the Railway Companies had "organized an efficient parcels traffic, do not you think "that they could compete with the Post Office upon "their own lines?" To which he answers,—"Cer-"tainly not. The Post Office having got an award "for carrying letters at a certain rate, choose to call "parcels letters, and they thus get them conveyed "without paying a single farthing to the Railway "Company."—The conclusion there is certainly incorrect. I am quite sure that Captain O'Brien would not intentionally give a false impression, but the impression upon my mind from that answer is, that the parcels are actually not paid for. I can only repeat what I said before, that in the arbitrations with the North-eastern Railway Company I never for one moment sought to exclude parcels. I have not the power of doing so if I wished to do so. I may state this, that in the last arbitration Captain Huish who was the arbitrator on behalf of the Railway Company raised a great point by referring to what he considered a grievance against the Post Office, that the Post Office robbed Railway Companies of the parcels traffic, and I stated, what I believe to be the fact, that a large amount of parcels carried by the Post Office would not be carried by the Railway Companies, because their organization would not admit of it, they not having a system of communication throughout the whole of the country, and that whatever is carried by the mails, whether it is parcels or letters, really pays the Companies a much higher rate than the Companies charge the public for ordinary parcels.

17,721. (*Mr. Hamilton.*) Is not the explanation of that answer that the witness was there referring to exclusive trains, that is, trains of which the Post Office had the exclusive use?—He could not have done so, because there is no such train on the North-eastern Railway; the only exclusive train running which I am aware of is that on the Great Western Railway.

17,722. It appears to me that the charge there intended to be made is, that having secured the service of carrying letters at a certain price, the Post Office then included in that service a new service for the carriage of parcels which it formerly had not, giving the Railway Company only the same remuneration?—That is entirely erroneous, because the arbitration upon which payment was last made by the North-eastern was after parcels had long been carried by the Post Office. The very fact of the carriage of those parcels, inasmuch as it was asserted that it robbed the Railway Company of traffic, was made by the Company's arbitrator a distinct ground of complaint and high charge. Not only was the fact of parcels being carried by the Post Office before the umpire, but the fact of their being carried was made a very strong argument, for a very high rate of payment and a very high rate of payment was awarded.

17,723. What was the rate of payment?—I find from the table which I hold in my hand of the last two awards for services by the North-eastern, that Sir William Cubitt awarded for a certain train 2*s.* 6*d.* per mile, and Mr. Stuart Wortley awarded for that train or a corresponding train 3*s.* per mile. Sir William Cubitt awarded 3*s.* per mile for a train for which Mr. Stuart Wortley awarded 3*s.* 6*d.* per mile. Sir William Cubitt awarded 2*s.* 6*d.* per mile for another train for which Mr. Stuart Wortley awarded 3*s.* per mile. The next train is the same. There is one train for which 2*s.* was awarded by Sir William Cubitt and the same amount by Mr. Stuart Wortley. For the following train Sir William Cubitt awarded 2*s.* 6*d.* per mile, and Mr. Stuart Wortley 3*s.* per mile. For the next train Sir William Cubitt awarded 3*s.* per mile and Mr. Stuart Wortley awarded 2*s.* 6*d.* per mile. For the next train Sir William Cubitt awarded 3*d.* per mile and Mr. Stuart Wortley awarded 4*d.* per mile. For the four next trains 4*d.* per mile was awarded by Sir William Cubitt and 6*d.* per mile by Mr. Stuart Wortley.

17,724. (*Mr. Glyn.*) That does not show your figures?—No.

17,725. Your figures are the other side?—Yes.

17,726. (*Mr. Hamilton.*) Do you say that the Post Office pays the Railway Company a higher rate for parcels than the public would pay?—Certainly.

17,727. Then why does the Railway Company complain?—Because they want to get as much as they possibly can.

17,728. Is it not the case that the amount paid by the Post Office for letters and parcels together is less than the amount which the Railway Company would receive, first, from the Post Office for letters, and then from the public for parcels?—If you are to divide that which goes in the mail bags in bulk into little separate parcels going either a few miles or a long distance, and take that away from the letter-bags, I suppose that Railway Companies would earn more if they could get all the parcels, but I think they could not get all the parcels because the rates which they would charge in some cases would exclude those parcels from going.

Mr. H. Gregory.

1 May 1866.

17,729. But if they got all the parcels that they carry now for the Post Office, and the public paid distinctly for them, you admit that payment might in that case be greater than the Railway Company now receives from the Post Office for the combined service?—I think it might.

17,730. (*Sir R. Hill.*) That is, if a charge were made on each separate parcel?—That is assuming that a charge was made on each separate parcel.

17,731. But they are not separate parcels, they are bags containing several parcels?—They are, practically, what are called "packed parcels."

17,732. Is it not the fact that all the attempts of the Railway Companies to charge packed parcels at the rate levied on each separate parcel contained in the package have been defeated?—I believe that the practical result has been that Railway Companies cannot charge a higher rate on packed parcels.

17,733. Have not all the decisions of the courts been to the effect that they have no right so to charge?—I do not know what all the decisions have been, but I believe the practical result is that Railway Companies cannot prevent carriers from packing parcels. There is no doubt that if the Post Office did not carry t ese small parcels, many of them might be made into packed parcels, and that jewellers' goods might be sent in a bookseller's parcel, for instance, while many of them would not go at all.

17,734. Can you say whether the Railway Companies have any monopoly of the conveyance of parcels; have they by their Acts any monopoly given them?—Not by their Acts; they have no legal monopoly of the carriage of parcels. I think that the terms of the notices under which the Railway Companies are required to perform the mail services require them to carry mails and post letter-bags.

17,735. Do you happen to know the date of the Act authorizing the North-eastern Railway Company to construct its main line?—I do not. That is a railway which has been made up of two or three other railways which were at last amalgamated into the North-eastern.

17,736. (*Chairman.*) Would not your calculations as to the cost of running an additional train for the Post Office also apply, in many respects at least, to any additional passenger train?—In many respects they would. They would not apply in all respects.

17,737. But they would apply to a considerable degree?—Yes.

17,738. Ought not the result then to be that in proportion to the increase of the amount of passenger traffic the working cost of an additional number of passenger trains on any line ought to be reduced?—I think that the increase of passenger trains would not produce in itself a proportionate increase in the cost. With regard to goods the increase of expense would be much more nearly proportionate, because if you have an additional quantity of goods you must have additional porters, and it would involve additional clerks and additional accounts. There have been certain elements of expense to which I previously alluded, such as the cost of renewals, which have come in to disturb the results which might arise from any comparison of present statistics with those obtained some years ago. And, again, the increase with regard to the passenger trains would come by fits and starts. There would not be an exact proportionate increase in general expenses; one train might cost nothing more in general expenses—two trains might cost nothing more—but a third train might involve an addition to the staff. Of course, the number of guards would always be increased.

17,739. Practically, the expense per train mile remains very nearly stationary whatever the traffic of the line is; is it not the case that the average on all the lines differs but little?—The result is, practically, pretty nearly the same if you take all the railways of the United Kingdom. If you take a large system you will find that comparing the expenses of several past years, although the mileage has increased, yet the mileage cost has not diminished, and that, I think, arises to a great extent from the circumstance to which I have alluded, that the expense of renewal has come in so much more largely.

17,740. (*Sir R. Hill.*) Does it not also arise in part from the circumstance of wages having advanced considerably?—Yes, that would be also an element of additional expense.

17,741. (*Earl of Belmore.*) Do you think it costs the same amount per mile to run a train backwards and forwards to the Crystal Palace as it would to run it backwards and forwards from London to Brighton. From London to the Crystal Palace is about five miles. Of course, if that can be done at 2*s.* 6*d.* per mile, each train will cost five times 2*s.* 6*d.*; would it cost 50 times 2*s.* 6*d.* to run a train to Brighton which is 50 miles from London?—You can hardly say what the cost would be without knowing whether you can get a good mileage out of the engines. On large systems you can generally get a better mileage out of your engines than on short lines. Then, again, the question of gradient and load becomes an element of comparison; the gradient is rather bad between London and the Crystal Palace.

17,742. I am assuming for the purpose of my question, that the gradients are the same. What I want to arrive at is whether you can say that it costs exactly the same sum under similar circumstances to run a train for a short distance as for a long distance?—Running on a short branch generally costs more per mile than running on a long line.

17,743. You cannot quote a fixed sum per mile irrespective of distance?—No, you cannot. At the same time there is this to be said, the comparison might go the other way in one sense; upon a short line you might very likely have a very small train, and upon a long line you might have a very long train which involves a larger class of engine, and consequently greater locomotive expenses. So you may say that the expense of running on a long line will, in some cases, be very great. For instance, take the express trains on the Great Northern Railway, which not only run at a very high rate of speed, but are very heavy trains, and are obliged to have enormously powerful engines. I believe those express trains consist generally of 14 or 15 carriages, and they run at a very high speed, and such trains as that will cost a great deal more than a short train, even though it may not have the advantage of running a long mileage.

17,744. (*Sir R. Hill.*) Your estimates are founded upon the cost of all the trains?—Upon the averages of running short and long trains.

17,745. (*Mr. Hamilton.*) Should you not, in order to get a safe guide, give average examples to show what it is at its maximum and what it is at its minimum on the different lines?—I think it would be almost impossible to give any rates but averages, which might not tend to mislead. I do not propose to put before the Commissioners the returns which I have in my hand, where the locomotive rates come out considerably less than anything which I have put before them. I know these returns to be true and correct, but I am aware that there are circumstances which make them less than the fair average, because the stock is to a considerable extent new.

17,746. Have you any returns which show on the other hand a very much higher rate?—Yes, I have no doubt I can find you cases where a passenger train has cost as much as 10*d.* per mile for locomotive power.

17,747. The mean which you give here is very little indication of the great fluctuation which may take place upon different lines?—I quite admit that; I think I said in the early part of my evidence that I always endeavoured when acting as railway arbitrator to ascertain what the costs were of the particular cases.

17,748. I am asking you these questions more with a view to informing us as to how far we can safely assume this as a practical guide. It may be true with referenee to all the railways of the country, but

yet it appears to me that it may be very fallacious as regards an individual line?—It may be fallacious no doubt; I think at the same time the rates which I have put down here are in most cases liberal. But if we assume a mail train running at a very high speed over very bad gradients and bad curves, the price might be brought up, not only to the amount I have named but to a larger amount. I have endeavoured to give my evidence from the very first with the intimation that the elements of the expenses vary in a very marked degree according to certain circumstances which I have alluded to, such as the character of the load, the gradients and the curves. I should be very sorry to say that any average would absolutely apply to every case. I think, however, from what I have seen of the mail service that the instances where my rates would be too low would be rather exceptional.

17,749. (*Sir R. Hill.*) I learn from your evidence that whenever the charges made by the Companies to the public for service are applicable to the determination of the charge, which should be made by the Post Office, you make those charges to the public the foundation of your estimates?—Yes.

17,750. Do the charges made to the public for the conveyance of passengers, parcels, and goods vary with reference to the badness of the gradients, and so on?—Well, I do not suppose that they do.

17,751. Does a Company which has a line of bad gradients charge more for carrying a passenger an equal distance than a Company which has a line of good gradients?—Not that I am aware of.

17,752. Then, in point of fact, the charges to the public, which in your opinion ought to be the foundation of the charges made to the Post Office, do not vary in the way that has been assumed?—No, the charges do not. I understood Mr. Hamilton's question to be with reference to expenses, not to charges.

17,753. (*Mr. Hamilton.*) I suppose the rule of the Railway Companies is that, so long as it keeps within its maximum limit that it fixes its charge at such a rate as is most remunerative to itself?—Yes.

17,754. (*Capt. Galton.*) Can you furnish any instances of the cost per train mile upon a railway on which a small number of trains run, and the cost per train mile upon a railway on which a large number of trains run, so as to enable the Commission to form any idea what proportion of the charges are charges dependent upon the traffic, and what are not dependent upon the traffic?—I dare say I can do so, but I think they might be fallacious, because it is so difficult to find cases which would be analagous in all the elements, excepting those to which you allude.

17,755. (*Chairman.*) In your opininion the cost of working goods trains considerably exceeds that of working passenger trains; do you include mineral traffic in that?—Yes.

17,756. Are you aware that it has been stated in some evidence before us that large mineral trains can be conveyed at a very much lower rate than the average of all trains, including both passenger and goods trains?—I was not aware it ever had been asserted that upon the average mineral trains would cost less. I am aware that some people have considered that the charges made for the conveyance of minerals might be less, but I have never heard it asserted that the cost of average mineral trains was less than passenger trains. If you introduce the condition of slow speed I certainly should think that the result might be materially affected, but I have taken what I find is the actual state of the case on the average of the railways of England, that goods trains and mineral trains have to run at a very high speed. If they could be run at a slow speed I do not think they would do so much injury to the permanent way as the passenger trains, and the cost of locomotive power would be diminished, but it is because they are obliged to run at high speeds that they inflict the damage on the permanent way, and cost so much for locomotive power.

17,757. The average speed is 10 miles per hour for a mineral train, is it not?—I cannot say what the average speed is, but I have seen them running between stations as quickly as passenger trains.

17,758. (*Sir R. Hill.*) The object being to keep out of the way of the passenger trains?—Precisely so. The traffic charges upon the mineral trains would no doubt be very much less than the traffic charges upon the goods trains, because the same staff of clerks would not be required, and the traffic expenses are not so great.

17,759. (*Chairman.*) Still you consider that really the most expensive part of railway traffic is the goods traffic as distinguished from the minerals?—Goods traffic would be more expensive than mineral traffic, and goods and minerals taken together would be more expensive than passengers. The earnings, upon the average, of goods and mineral trains are greater than the average of passenger trains.

17,760. In the single instance where there is an exclusive train, what does the Post Office pay per mile?—The general agreement with the Great Western now includes all mail service, but the award was 3*s.* 9*d.* per mile for the exclusive train.

17,761. In your opinion, about 2*s.* 4*d.* would have been sufficient?—In that particular case there were circumstances which made the service specially inconvenient and expensive, and I was prepared to agree with the railway arbitrator, the late Mr. Saunders, upon 3*s.* 6*d.* per mile, but we could not agree upon the rates for the other trains; the consequence was the whole question went to the umpire.

17,762. What was the award in that case?—3*s.* 9*d.* per mile.

17,763. (*Mr. Hamilton.*) Was that an exclusive train?—Yes; and it was a train which I thought involved some items of expense for which I made special allowances. It was a heavy train with several Post Office carriages specially fitted up; it required an extra staff, and interfered with the working of other traffic.

The witness withdrew.

MR. ARCHIBALD STURROCK examined.

Mr. A. Sturrock.

17,764. (*Chairman.*) I believe you are the locomotive superintendent of the Great Northern Railway?—I am.

17,765. The Commission are anxious to obtain some information from you with regard to the various elements which constitute the cost of running trains in the locomotive department.—The principal cost is the cost of engine power; afterwards, in the passenger trains the passenger carriages, and in the goods trains the goods vehicles or waggons. The cost of the locomotive power consists in labour and materials. The principal running cost in working the train is the coke or fuel burnt. Then come the different wages. The greatest individual element is the cost of repairs to the engines, then the cleaning, the oil and coking, and other small matters that form the cost of running a locomotive.

17,766. (*Capt. Galton.*) Can you give any idea of the general average of the cost of either goods engines or passenger engines for each of those services?—The cost of engines is determined greatly by the amount of work done by each, that is, the load they carry and the speed at which they run. On the Great Northern Railway the average cost of the engines over a period of 10 years, from 1st January 1856 till 31st December 1865, has been 8½*d.* per train mile.

17,767. Is that the whole cost of the engines?—That is the whole cost of the engines.

17,768. Including repairs and renewals and cost of

Mr. A. Sturrock.
31 May 1866.

every description?—Including everything. That is the average cost for 10 years ending in 1865.

17,769. (*Sir R. Hill.*) What is usually called the cost of locomotion?—Yes, the cost of the engine. That does not include the vehicles dragged at all; that is the mere cost of the power.

17,770. (*Mr. Glyn.*) All the repairs and the renewals?—All the repairs and the renewals. But the cost of the engine is increasing. The cost for 1865 individually was 9·577*d.*

17,771. (*Capt. Galton.*) To what do you attribute the increased cost of the engine?—It is principally attributable to the fact that there has been no infusion of new engines. I consider that the cost of railways will gradually increase (but to what extent I am not prepared to say), for two reasons. In the first place there is a serious increase in the price of labour, and there is also a serious increase in the cost of fuel. Those two items form a considerable portion of the cost of locomotion. In the first place locomotion will increase, in my opinion, to some extent, for those two reasons; and in the next place, I consider that as railways become older, and there is a smaller number of new railways and a less infusion of new stock and new railways into the railway system, that the cost will gradually go up.

17,772. Do you mean the cost of maintaining the old stock?—Yes, and the cost of working railways in point of fact, because if you add a new railway to the old one, it is perfectly clear that you have a considerable advantage in working a new one. I have cut out the first five years of the Great Northern's existence altogether, because I did not consider it was a proper element to bring before you, as the whole railway was new, the whole of the engines and rolling stock were new, and hence they were worked at a very small cost. The cost I have given you has been the cost of the last 10 years of the life of a railway 17 years old, not the whole life of the railway. There has been an infusion of new vehicles during that period. During the last nine years there have been very few new engines bought on the Great Northern, because the traffic remained stationary for a long period and there was no reason why we should buy new engines. In 1863 the traffic ran up, and has continued to run up, and has gone up very much; hence the cost of the maintenance of the stock has become greater. The old stock has been obliged to do a greater amount of duty, but it is requiring a little more maintenance, and the engines, which on the average only cost 8½*d.* formerly, now cost 9½*d.*

17,773. A considerable proportion of that increase was due to the increased price of coke, was it not?—A portion, but not a considerable proportion.

17,774. Can you state to what extent the price of coke had risen in the 10 years you have named?—There is not a great portion of that amount due to coke, because the Great Northern Railway is gradually giving up coke and taking to coal. There is no doubt there is a certain cheapness in coal, and that coal is a more economical fuel than coke. I think there is at least three-fourths of a penny due to the maintenance of the engines during 1865.

17,775. Do you pay your engine drivers a higher rate of wages now than you did formerly?—They are a highly paid class of men, and always have been.

17,776. Are the wages of all your servants generally increased?—They are all very much increased. I should think we are paying 10 per cent. more for wages within the last 18 months.

17,777. (*Mr. Horsfall.*) But an increased cost of fuel, be it more or less, may be merely temporary?—Of course that is a very difficult question to determine. My own opinion is that the price of fuel will go up even higher than it is.

17,778. But it may be otherwise?—It may be otherwise decidedly. A very great depression in the iron trade of this country would affect the price of coal very materially, and no doubt of coke also.

17,779. (*Mr. Hamilton.*) In arriving at your estimate of the cost, do you take the actual value of the engines on hand at a given period?—No, I am speaking of the current cost.

17,780. You treat the engines as a charge upon capital?—Yes. That does not include the interest at all.

17,781. The 8½*d.* per train mile which you have given as the cost of locomotion only includes maintaining the engines in efficient order, paying wages, and providing fuel?—Yes; working the engine, and maintaining it to go on for ever, but not to go into the question of actual value, because I conceive that no railway will ever go into the market to sell its stock.

17,782. But still, as a matter of account, I should think it must be taken in?—The locomotive engineer generally writes a letter to say that he considers his rolling stock is in good working condition. That is the extent to which railways go into the question of their rolling stock. I do not think a railway company ever values their rolling stock as a valuer would do.

17,783. Then it is wholly irrespective of the interest on the money expended in the original purchase of the engine?—Yes; the figures I have given you are entirely for the working of the engine and maintaining it.

17,784. (*Sir R. Hill.*) And renewing, I presume?—Yes, I hold that repairing means renewing; I do not believe in the word replacement. I think that once a railway company has bought a vehicle or an engine, it ought to be repaired, and in that way admit of going on for ever.

17,785. (*Mr. Glyn.*) The price of engines is rather increasing, is it not?—Yes, the price of engines has increased lately on account of there being such a demand for them.

17,786. (*Sir R. Hill.*) Is the increase in the price of engines owing mainly to the higher wages paid to the artificers?—No, I think it is mainly owing to the very great demand for them.

17,787. (*Mr. Hamilton.*) Do you keep the wear and tear of the engine as a matter of revenue account?—Yes; everything expended upon an engine after it has once been purchased by capital is charged to revenue.

17,788. Suppose when it is worn out you buy another; what do you do then?—Then it is charged to revenue.

17,789. Would that 8½*d.* per train mile cover the repurchase?—Yes.

17,790. (*Capt. Galton.*) When you once put an engine on the line you keep that engine up for ever?—Yes; the engines are maintained for ever out of this 8½*d.* We rebuild our engines. If you purchase an engine entirely it would be spending more money than is necessary, inasmuch as though it is very probable that an engine has to be altered in construction when it is wanted for different descriptions of traffic, yet there is always a pair of wheels or an axle or some portion of the engine which comes in, and hence it cheapens the cost of producing a practically new engine.

17,791. (*Mr. Horsfall.*) It includes, in fact, an entire replacement?—Yes, maintaining for ever the engines that have been bought by capital.

17,792. (*Sir R. Hill.*) The 8½*d.* per train mile I think you stated to be the average cost of all engines whether for passenger trains, or goods trains, or minerals?—Quite so.

17,793. Can you separate the cost of one from the other?—To some extent I can, but it is a very difficult thing to get from the accounts the exact cost of running a fast train against a slow train for this simple reason, that a goods engine which runs with an express goods train from Peterborough to London probably goes back from London to Peterborough with a slow train, and you could not keep those details without such voluminous accounts as do not exist on railways. I have endeavoured to look into that question. I find that the cost of working a passenger train of seven carriages on the loop district of the Great Northern Railway has been 5·9*d.*, or about

6*d*. At Peterborough station it works out an average of 7·63*d*. for 8¼ carriages.

17,794. (*Mr. Glyn.*) Are the gradients much the same in both cases?—On the loop it is practically a level line, and the traffic is carried on more slowly. The loop goes from Peterborough to Lincoln, and then the East Lincolnshire from Boston to Grimsby. The loop line is almost a level line. It requires a much less powerful engine than the other part of the line requires.

17,795. (*Sir R. Hill.*) Are the engines smaller?—Yes.

17,796. Are they what are called tank engines?—We have a considerable number of tank engines. A tank engine answers very well for short branches or short distances, where a great deal of water is not required. The cost of the engine in the London district is on the average 8½*d*., and, including carriage repair, 10¾*d*. per train mile.

17,797. (*Chairman.*) Is that an average of the whole?—Yes. Goods engines which have carried 25 vehicles, and which go at a slower speed, have cost 8·99*d*., which brings up the average to 8·5*d*., which is about the same as the London passenger engine.

17,798. (*Mr. Glyn.*) Do you include the engines for mineral traffic in your list?—Yes, the goods and mineral traffic we keep together; we do not separate them; they are worked by the same description of engine.

17,799. (*Sir R. Hill.*) Do these estimates include the expense of what may be called the locomotive establishment and its officers?—Yes, everything; the whole cost of carrying on the establishment.

17,800. (*Mr. Hamilton.*) Only special services, I presume, and not a share of the general service?—No; that is merely the locomotive department; that is all the officers necessary to work the engine, firemen, labourers, cleaners, in fact, every person who is employed in the department.

17,801. (*Chairman.*) How do you calculate the amount of mileage; do you take merely the distance run from station to station, or is it an addition made for work done at the station, such as shunting?—No; the train mileage of the Great Northern is calculated by taking the exact distance from station to station. There is no addition made for shunting at stations, but there is an addition made for the mileage run or work done by engines which are specially provided to shunt. For instance, at King's Cross there are 8 or 10 engines continually shunting; those engines are charged as train mileage, instead of being paid for in money. The locomotive engineer is ordered by the traffic manager, or his subordinate, to send an engine out for the purpose of shunting. The cost of that engine per hour has been ascertained accurately, and, according to the number of hours it is employed, a mileage charge is added to the train mileage of the Great Northern.

17,802. (*Capt. Galton.*) How many miles do you put to each hour?—Seven miles per hour.

17,803. What is the most economical arrangement for running your engines with trains?—We are running on our main line engines 200 miles per day, from London to Grantham, and back again from Grantham to London.

17,804. How many days a week will they run that?—Four days a week, and sometimes five, if we are pressed for engine power.

17,805. And two or three days in shed?—Either one or two days in shed; they are never more than two.

17,806. That is out of six days?—Out of six days. I am not referring to Sunday, because we have very little traffic on Sunday.

17,807. (*Mr. Glyn.*) That is very full work for an engine, is it not?—Very full work; these engines run very much beyond the average.

17,808. (*Mr. Hamilton.*) With reference to making up the accounts of train mileage, are you aware whether the same system that you adopt on your railway is adopted by other railway companies?—I think not. There is the greatest possible difference in the way the accounts are kept by different railway companies.

17,809. It is very difficult, therefore, to form any comparison?—Extremely difficult; there is generally not one element alike.

17,810. I am alluding to the number of miles. Is shunting charged in some railway accounts?—It is in some, but in others they do not charge it at all.

17,811. Then that would disturb any comparison of the receipts?—Yes. On other railways they add 10, 15, or 20 per cent. for work done at roadside stations. There is no doubt there is a considerable quantity of work done at roadside stations. It is not an uncommon thing for an engine to shunt at a roadside station; that does a good deal of damage to the engine, and I have known 15 or 20 per cent. added on the mileage for that.

17,812. (*Mr. Glyn.*) You would not venture to make any general average for all the railway companies of England?—No, I should not venture to do that.

17,813. (*Mr. Hamilton.*) Has any attempt ever been made by railway officials to settle what should be the allowance made for the purpose of comparison among themselves?—No, I think not. The various officers have from time to time prepared their own accounts. I know that the Midland charges are very much the same as the Great Northern, but I do not think there has been any any attempt to get an uniform system of accounts; such a thing does not exist.

17,814. An uniform system of railway accounts has not been made?—No, I do not think it exists in England at this present moment.

17,815. (*Mr. Glyn.*) I suppose if any large engine manufacturer undertook the working of the line with his own locomotives he would be obliged to have all the details?—Yes.

17,816. That has been done, has it not?—Yes; railways have been worked by contract, but it has been done very much to their detriment, inasmuch as they had to pay little per-centages for every vehicle, &c., and that ran up the cost to something ridiculous.

17,817. They are made to cover contingencies?—Yes, but those charges come up to an enormous cost.

17,818. (*Capt. Galton.*) What is the average number of miles run by engines upon your line?—We have lately been running 24,000 miles a year with our goods engines, which is a great deal too much. We have only done that from being pressed for power. We did not choose to refuse traffic, and so we forced our engines to run, repairing them during the night and at all times and seasons. But we are endeavouring to get out of that position, for it is not a good position for any railway to be in.

17,819. You do not consider that fair work for an engine?—No, I think 20,000 miles a year is about as much as it is possible to get out of an engine with the greatest economy. It is more economical to buy new engines than run the engines too much.

17,820. 24,000 miles a year would give an average of 80 miles a day?—Yes.

17,821. An engine has to go into the workshop for a certain portion of the year?—Yes.

17,822. For what portion of the year?—For two months out of the year.

17,823. Then it has to spend one-sixth of its time in the workshop?—Yes; and then it has its days in shed, or ought to have; for instance, a Great Northern goods engine running from Doncaster to Peterborough and back every day, should not run more than three days without being kept one day in the shed. If that is not done it is not possible to keep the engine in order. It is not properly washed out, and there is a residuum left in the boiler which would ultimately do great damage. If you attempt to wash out the boiler before it has cooled down that is very injurious, because you injure the structure of the boiler excessively by running cold water into a boiler which is partially hot. 20,000 miles a year are quite enough for an engine which is 10 or 12 years old.

Mr. A. Sturrock.
31 May 1866.

In the early history of a railway you may very well run your engines a little more, because they are all new, and will not require much repairing. I am at this moment turning out a new engine every week, or practically a new engine, for it has a new boiler, cylinder, or framing.

17,824. You do not add an engine a week to your stock ?—No, I am simply replacing. The age of the engines, and the great work they have done, obliges me to do that to maintain the number of engines. An engine cannot be taken in and rebuilt under three months.

17,825. (*Mr. Glyn.*) What is the working stock of the Great Northern goods and passengers ?—I have about 437 engines, and shall have 453 very soon. We are buying engines.

17,826. (*Capt. Galton.*) Do you replace your engines every eight years ?—That is too often; I think if you replace an engine every 10 or 12 years that is as much as is necessary.

17,827. You think your engines ought to last that time ?—Yes.

17,828. (*Mr. Horsfall.*) Are there no railway companies who still have their locomotive power supplied by contract ?—I believe very few.

17,829. It being found to the disadvantage of the company as well as more expensive to the public ?—Yes.

17,830. (*Mr. Hamilton.*) But all of them buy occasionally, I presume ?—Yes; we purchase all our new engines—all our additions; if we increase the number of our engines we buy.

17,831. You do not make them ?—No; we have not workshops sufficient to enable us to do more than repairs and rebuild old ones. Our workshops are sufficient to replace the old ones, that is, to keep up the number, but nothing more.

17,832. (*Capt. Galton.*) Have you introduced steel into your engines lately ?—I am using steel tires universally; I am replacing all the iron tires by steel tires.

17,833. What is the relative length of life of a steel tire as compared with an iron tire ?—I believe the steel tires will last twice or three times as long as the iron tires. The express engines of the Great Northern Railway wore out a pair of Low Moor best Yorkshire iron tires in 40,000 miles.

17,834. They have been turned in the meanwhile I presume ?—They had been turned twice. The engine had been brought into the shops, and the tires turned up twice. They were originally turned, and were turned up twice again. I have lately taken off some steel tires worn out; we got 112,000 miles out of them.

17,835. How often have they been turned ?—Twice after being put on.

17,836. What were the relative prices of the two ?—I paid about 65*l.* per ton for the steel, and the iron 40*l.* I think there is a considerable saving as far as the permanent way is concerned as well.

17,837. Have you tried any steel rails yet ?—Yes; there are some steel rails laid down, but not any considerable quantity.

17,838. Do you find the result is the same with regard to the rails ?—I am told it is favourable, but I am not sufficiently informed to be able to give the exact statistics. I do not think the Great Northern have yet made up their minds as to the value of steel rails.

17,839. (*Mr. Hamilton.*) Is your experience gained from the use of any particular quality of steel ?—I am using Krupp's steel from Germany; I am also using Vickers' and Butcher's steel from Sheffield and Monkbridge—Taylor, Brother's, and Bowling's steel from Leeds.

17,840. You do not think it suffers under the influence of sudden changes of temperature ?—I believe steel is excessively strong, but it requires more careful manipulation in applying it to wheels than iron does. If a steel tire is carelessly put on and too much contraction given to it it will break very readily.

17,841. Have you ever had an accident from that cause ?—None. Of course I have had a broken tire. I think that steel properly applied is safer than iron. I think they are very strong indeed.

17,842. Do you use steel for axles ?—I am using steel now. I am trying crank axles. English steel crank axles have not done very well with me, for the crank axles which have been put on our express engines have broken rather earlier than the iron. Krupp's steel appears to answer remarkably well. I have two or three cranks running which have run far above the average life of an English iron axle; they are perfect yet; I cannot detect any fault in them.

17,843. What is the average life of an iron crank axle ?—They vary with the different descriptions of traffic. The engine of the Great Northern, which drags from 15 to 17 carriages in a train from King's Cross to Peterborough in 1 hour 35 minutes, breaks its axle in from 38,000 to 45,000 miles. The goods engine, which runs more slowly, works often 150,000 miles.

17,844. Do you always run an axle till it breaks ?—No.

17,845. How do you avoid that ?—I hoop every axle when it is made. We examine them every time they come in. I have no doubt that an axle begins to break from the day that it first goes out. We do not take an axle out until it shows a flaw, and even then not immediately, because we know when to take it out so as to prevent any danger of an accident. We take care to prevent it breaking on the road. If we should make a mistake, and the engine-man finds that the valves are not working right from the crank axles springing a little, of course he does not keep on full speed. He gets down and examines the engine and goes on slowly to the next station. I do not think there is any danger to passengers on good railways from crank axles breaking.

17,846. Do you introduce steel tires to your tenders ?—Yes, I am trying them

17,847. And to carriages ?—I have not put them on to carriages yet, but I believe they will be put on to carriages.

17,848. You think it will be a more economical arrangement ?—I think so. I have not put steel tires to carriages yet, simply because before one has had a certain amount of experience one does not like to take the responsibility. That is the only reason why I have not introduced them to carriages, for I believe them to be perfectly safe, and I have no doubt that ere long they will be applied to carriages.

17,849. Do you think that less attention would be paid in applying them to carriages than to engines ?—It might be so. I think that steel will be used more so soon as further experience has been had of it. I think that that experience does not yet sufficiently exist.

17,850. Then the use of steel, you think, gives some prospect of reducing the cost of working railways ?—I think it will reduce it in two ways; *per se* it will be cheaper, and it will enable the engines to run for a longer time and keep them out of the workshop, which will be a great advantage.

17,851. (*Chairman.*) Is there any other direction in which you can see any possibility of reducing the cost of locomotive power ?—The only way that I can imagine in which you can introduce economy in working passenger traffic would be by massing the trains and passengers as the French do, that is, filling every carriage and running few trains. That no doubt would diminish the locomotive expense of running passengers.

17,852. If passengers would submit to that proposal could any large diminution of expense be effected ?—Ten carriages cost 11*d.* Suppose you put 60 passengers into 10 carriages, which is not a large number, being only six passengers to each carriage, that number at 2*d.* would be 10*s.* per mile, and the per-centage of cost is 9·1. If you slow the speed

and fill the carriages you might get 90 passengers into them, and the per-centage would not be above 6·4. That is what it works out. There is no doubt whatever that an engine which drags a parliamentary train or a slow train, and burns about the same quantity of fuel that an express does, can take half again as many carriages comfortably.

17,853. (*Capt. Galton.*) Then the parliamentary trains are probably the best paying trains upon the line, because they are probably full of passengers?—I think that is very likely; they convey a greater number of passengers no doubt than the other trains. They mass the passengers together. In that way you might make them all more or less paying. If you can run a through train with a large number of passengers and with a comparatively small number of carriages, that would be the cheapest way of working passenger traffic; but then the difficulty would be in England to get a sufficient number of passengers going that long distance. In France, where they run fewer trains and stop more frequently, they fill their carriages much more than we do, and consequently they carry on their passenger traffic more cheaply. If we could have more passengers in each compartment and the rate of speed reduced, I have no doubt the cost of working trains would be cheapened.

17,854. (*Chairman.*) That would have a tendency to diminish the number of passengers, would it not?—It probably would, but at present any railway company which refuses to run trains at the same pace as another, and to give the same convenience, immediately loses its traffic.

17,855. (*Capt. Galton.*) Do you consider that speed adds very largely to the cost of running trains?—I do.

17,856. Can you give any idea of the proportionate increase of cost which is caused by speed?—It increases the cost directly; probably an engine which costs 7½*d.* per mile in one case would cost 8½*d.* per mile or 9*d.* per mile in another case running fast.

17,857. With what speed?—A difference of between 30 and 40 miles per hour. But then there is another element, it reduces the load, which is a much more serious thing than the mere cost of the engine. A train to cover 30 miles an hour would cost 1*d.* more than a slower train, and the latter would drag half more carriages. I am speaking of the locomotive cost. Every other account, such as signals, permanent way, &c., will increase with speed, because you must have your signals much better, and the cost of maintenance is greater, because the rails are damaged to the same extent as the engines.

17,858. Have you ever compared the cost of locomotive power on the English railways with that of railways in France and Belgium?—Not very carefully; I have spoken to French engineers upon the subject.

17,859. Do you think the difference is represented by the difference in the quality of the service?—Yes; I think that their cost is often greater than ours.

17,860. Even with a less goods service?—The reason is that they do not get their fuel so good or so cheap as we do; however that is improving every day, and their cost is getting down. But they carry their traffic very differently to us; they carry it in such large loads that generally speaking the cost per train mile is very considerable.

17,861. One would naturally suppose, other things being equal, that the cost would be less because their speed is so much less?—Their per-centage is less. I have no doubt their cost of repairs is very great, one reason of which is that their workmen possess less mechanical skill than the English workmen. But they are improving very rapidly. The French and Germans are both improving very rapidly as mechanics, and in fact are running the English very hard now.

17,862. Are they as highly remunerated as the English workmen?—No, but still the fact is that the expensive English workmen are being less used every day. The production of the workshops of England is being increased by the use of improved tools, and those tools are again worked by a low class of labour. Abroad they are introducing the best tools, indeed quite as good as we ourselves use; and their low class of labour, which is paid much less than the average, produces from good tools quite as much as we do. I was speaking of a time when their skilled labour necessarily produced all the parts of engines. Now the parts of engines are produced by labour with less skill but good tools. They get just as good tools as we do; in point of fact they obtain their tools from English makers.

17,863. By tools you mean engineers' machinery?—Yes, lathes, planing machines, drills, and so on.

17,864. (*Mr. Glyn.*) Then in point of fact they work their railways at a considerable cheaper rate than we do in England?—Yes.

17,865. (*Capt. Galton.*) You have given 8½*d.* per train mile as the cost of engines?—Yes.

17,866. Can you state what the addition is for the cost of a carriage?—The cost of working a train of seven carriages on this line was 1·47*d.* The total cost of working that train was 7·37*d.* The cost of working a train of 8¼ carriages was 1·74*d.* The whole cost of that train was 9·37*d.*

17,867. What does the cost that you put down for the carriages include?—Maintaining the carriages for ever.

17,868. Repairs and everything?—Yes.

17,869. (*Mr. Glyn.*) Does it include the first cost?—Not the first cost; merely the repairs and the cost of working.

17,870. It includes replacement?—Yes. The cost of working a passenger train of 10½ carriages was 10·75*d.*, while the repairs of the carriages was 2·21*d.* The cost of working a mixed goods train is 11·59*d.* on the average.

17,871. (*Capt. Galton.*) How many waggons?—Twenty-five vehicles. That includes the small goods trains on the branches.

17,872. Can you state what the cost of a coal train is?—The cost of a coal train of 35 vehicles is about 9½*d.* per mile; for the engine and the vehicles about 3½*d.*, so that it would be about 13*d.*

17,873. But then, as it is run one way empty, that has to be doubled?—That has to be doubled decidedly. A coal truck is rather an expensive article. It carries a larger weight a great deal than a goods truck, and thence it wears out much faster and is more expensive to maintain than an ordinary goods truck. An ordinary goods truck does not carry more than two tons on the average, and the coal trucks carry from seven to nine tons. That must be divided by 2 on account of its having come back empty; but still, a vehicle which is loaded at one time with from seven to nine tons running over the line does more damage to itself than if it ran double the distance with half that load.

17,874. (*Chairman.*) What is the speed of your coal trains?—20 miles per hour is what is put down in the time bill, but they far exceed that on a great portion of their journey, because, with a view of keeping the traffic regular, they have to give way to passenger trains; and on the other hand they are loaded to such an extent (because every ton is a paying load) that they do not get up the rise of the gradients as fast as the average time, and hence they are obliged to run down the other side a little more quickly. In fact, the coal trains of the Great Northern Railway run 30 miles an hour down inclines. If a train from Edinburgh comes up behind a coal train, the coal train has to shunt into a siding in order to enable it to pass, with a view of keeping as great regularity as possible; but afterwards the coal train is forced on, if possible, to keep its time, so that it overruns the average speed.

17,875. Could coal trains be worked much cheaper if there were not passenger trains on the same line?—I think so, because then coal trains might be worked at a lower and at an average speed, which would diminish the cost.

17,876. (*Capt. Galton.*) What do you consider the most favourable speed for economical working?—I should think about 15 miles per hour. I am speaking of actual speed, not the average speed.

Mr. A. Sturrock. 31 May 1866.

17,877. (*Mr. Hamilton.*) Would the reduction in the price of coal be considerable, irrespective of the cost of working the train?—It would be something, no doubt; but it is rather difficult to say what it would be.

17,878. (*Mr. Glyn.*) What rate per mile do you think you could carry at under those circumstances?—Coal is being conveyed now at three-eighths of a penny per ton per mile. I think you might take one-sixteenth of a penny off, and in all probability it would leave a small profit then.

17,879. (*Capt. Galton.*) How many tons do your coal trains carry?—An ordinary engine carries from 210 to 220 tons net. An auxiliary steam tender engine takes 320 tons net. On the Northern Railway of France, where the gradients are similar to the Great Northern, they carry 350 to 450 tons net. By going much more slowly we might greatly diminish the cost of conveying the mineral traffic in England. I have thought it advisable to make use of the tender, and with that view I have lately added cylinders to the tenders of the Great Northern engines. This has enabled them to use the adhesion of the tender, whereby we have increased our net loads 100 tons.

17,880. Then you go at a lower speed?—No, you cannot alter the speed on the Great Northern. By using the tender the cost is increased about 1*d.* per mile in repairs, and one halfpenny for fuel, but then we get an additional 100 tons.

17,881. It in fact adds 1½*d.* to the cost of your locomotive power?—Yes; and it adds 100 tons to the net load, which is a very considerable amount.

17,882. Are you carrying all your coal traffic in that way?—A very large quantity of it, but it is to some extent still an experiment. We have 50 of those tenders at work.

17,883. Then that is one way in which economy can be produced in the working of coal trains?—I think so, and in my opinion it would be a very considerable economy wherever you have gradients as bad as 1 in 200. I would not recommend such a mode of dealing with minerals on a level line, nor for goods on gradiends of 1 in 200, because the train necessary to exhaust the power of such engines would become so long as to be unmanageable. I believe great economy would be produced in working the mineral traffic on gradients beginning at 1 in 200, or for goods on 1 in 100, if such a plan were adopted.

17,884. What is the length which you consider renders a train unmanageable?—About 400 or 450 yards.

17,885. That would be how many waggons?—From 60 to 65 waggons. If you take seven yards for a truck with the couplings loose, you cannot couple up a goods train of that length so as to render it manageable.

17,886. It must start in separate portions?—Yes. From 280 to 300 yards I think quite safe. If you were to take 60 trucks, which you would require to put on the Great Western line, for instance, to use the powerful engines which I was speaking of just now, you would get from 420 to 500 yards.

17,887. It would, in fact, become unmanageable and very unsafe, and there would be great difficulty in shunting at the small stations?—Very great difficulty indeed; you would have to prepare sidings for the purpose.

17,888. (*Mr. Hamilton.*) A witness who has been examined to-day stated that he considered great injury was done to the permanent way by goods trains, arising from the waggons being loosely coupled. I understand you to say that is to a certain extent unavoidable with large loads?—It is quite unavoidable with all goods traffic, except where one or two goods trucks are taken with passenger trains. We tried it on the Great Western 20 years ago, and found it quite impracticable; we could not start from the station. When once you get the train in motion, there is no difficulty in going on, but it is impossible to start it.

17,889. Without a jerk?—Yes; each waggon must start separately, and at last the engine gets into power, and the momentum of the engine is then sufficient to carry on the train. Very often it happens that an engine cannot start a passenger train until it has moved back.

17,890. (*Chairman.*) Have your goods trains generally, as distinguished from minerals, full loads?—In number they generally are; they rarely start with less than the full number of trucks, except what are called picking-up trains. There are a certain number of trains on every railway which are called picking-up trains, which necessarily start with a light load, otherwise there would not be any power in the engine to pick up at the different stations. But generally speaking, all the goods trains run with the full number of trucks.

17,891. You do not see any prospect by any convenient process of reducing the number of the goods trains?—It was the practice one time to transhipp goods, but competition has created such great speed in goods trains that it has been found impossible to continue the system of transhipping. By transhipping I mean a system of stopping a train at a station, taking some goods out of a truck, and then letting the train go on. For instance, the merchants at Leeds require their goods to be delivered in London at a certain hour in the morning. The Midland say, We will give you half an hour longer at our station at Leeds if you send the traffic by us, and of course the Great Northern Company are obliged to do the same. That competion has been so severe that it has forced the speed up very much. Hence the trains are carried at a great cost to the companies. No doubt if the speed were diminished the work might be done with fewer trains.

17,892. As a general rule the whole of the load of any one truck must be delivered at the same place; you cannot divide a load between different places?—No, practically that is never done on the principal English railways. I believe that on the average goods trucks do not carry more than two tons. They are generally capable of carrying more. I do not think any of the vehicles are built to carry less than six tons.

17,893. Are there any other details of expenditure with reference to the working of railways on which you are prepared to give evidence?—The permanent way of the Great Northern Railway has cost during the last ten years 5·13*d.* per mile. In 1865 it cost 5·88*d.* per mile, showing a slight increase.

17,894. (*Capt. Galton.*) Then you think, with reference to all the items of expenditure in which labour forms an important element, that the cost is increasing?—I think so. The other expenses of the Great Northern Railway amount to 12·09*d.*, but in 1865 they amounted to 12·48*d.*, showing an increase, arising, no doubt, from the same reason, namely, an increased cost of labour.

17,895. What does the whole cost of running a train on the Great Northern come to?—The whole cost of running trains on the Great Northern Railway for the last ten years has been 27·98*d.* The cost in 1865 was 30·685*d.*

17,896. That is a very material increase?—It is a very material increase. There has been an increase in the locomotive expenses from 10·76*d.* to 12·33*d.* divided in this way, that engines which cost 8·50*d.* have cost 9·577*d.* Carriages and waggons which cost 2·26*d.* have cost 2·75*d.* The permanent way, which cost 5·13*d.* has cost 5·88*d.*, and the coaching merchandise, traffic, compensation duty, &c., in fact, all other expenses, have run up from 12·09*d.* to 12·480*d.*, or an aggregate of 30·68*d.* instead of 27·98*d.*

17,897. You have given the number of miles run by engines; can you give any information as to the number of miles run by carriages and waggons on the average?—No.

17,898. I suppose that calculation is not kept by any railway in the kingdom?—It is not kept on any railway in the kingdom. It has been estimated on many occasions, but I am afraid to give the figures because it has been estimated so very differently.

17,899.—It is comparatively a small mileage, is it not?—A very small mileage.

17,900. Do you think any public advantage would be derived from all railway companies furnishing their returns on the same principle?—I think it would be very desirable. I do not think even then, an accurate comparison could be made except by skilled people. You might get the elements of the accounts the same, but you would not get the description of the railway. Railways vary very much; of course the same figures on two different railways would not enable you to make an accurate comparison, unless you knew something of the railways. Different railways convey different descriptions of traffic. For instance, it is costing me more to work the omnibus traffic of the Great Northern, than it costs the Midland to work their main line traffic. We get much less duty out of an engine, and some of our drivers instead of running 200 miles a day, do not run more than 60 miles a day.

17,901. Is that on account of stopping so frequently?—Yes, they stop about; they stop a long time at Ludgate Hill before they return to King's Cross.

17,902. Do you think there would be any difficulty on the part of railway companies in agreeing on some uniform system of making out their returns?—I do not know why there should be. If it could be done it would be a great convenience to everyone, but I have no doubt it would be very difficult to arrange.

17,903. (*Mr. Glyn.*) Therefore there would be some difficulty?—There would be considerable difficulty in getting the different officers and accountants to agree.

17,904. There would be great difficulty probably in getting the different officers of each railway company to take the same views?—Yes, I believe there would be considerable difficulty, but it would be very advisable if it could be done.

17,905. And also great difficulty in getting the officers to adhere to it when it was laid down?—I think that might be overcome; if you could only get officers to once agree, I think the subsequent officers might be obliged to do it. It would be quite easy to keep up the system of accounts when once commenced.

17,906. (*Chairman.*) Has any plan of the kind been discussed among railway managers?—I do not think it has ever been seriously discussed. They meet at the clearing house and try to enact rules about the accounts, but there are no means of carrying them out. It has never been seriously attempted, I believe.

17,907. Is there not a general tendency to a better understanding by railway companies on these points than there used to be?—I think so; I think railway companies are becoming a little more sensible.

17,908. (*Capt. Galton.*) There is not the same difficulty that there used to be by reason of competition?—There is plenty of competition, but I think railway officers now take a broader view of things than they used to do.

17,909. Do you compete for Manchester traffic?—Yes; I think the competition is just as great as it was before. I do not think competition from difference in charge exists, but in other respects, convenience, speed, &c., is as great as ever it was.

17,910. Competition for convenience is a very much more legitimate competition than for charges.—So it is.

17,911. (*Mr. Glyn.*) Competition for accommodation applies to passengers as well as to goods?—Yes; it has a great effect on the circumstances of the railway. I met only the other day a gentleman from Scotland whom I had not seen for a long time, he said to me, "Your carriages are very good, we come to you "because you give us such nice carriages." That shows that if a company is liberal in the way of accommodation the public value it.

17,912. (*Chairman.*) Do you think if your company were to reduce the number of carriages that you would lose any traffic?—I have no doubt that if our company reduced the number of carriages that that would instantly reduce its traffic.

17,913. Will you put in the various tables to which you have referred during your evidence?—I will.

The witness delivered in the same, which are as follows:

COST of WORKING a TRAIN of 16½ mixed Vehicles a Mile on the GREAT NORTHERN RAILWAY to End of 1865.

WORKING EXPENSES.			1865.
		d.	
Engines (*See* Appendix A.)		8·50 per train mile	9·577
Carriages (*See* Appendix B.)	1·74	2·26 do.	2·32
Waggons	2·60		3·00 } 2·748
		10·76 do.	12·325
Interest on capital, Locomotive Department (*See* Appendix C.)		3·77 do.	
		14·53 do.	
The maintenance of way (*See* Appendix D.)		5·13 do.	5·880
The coaching and merchandise traffic, compensation duty, &c., &c. (*See* Appendix D.)		12·09 do.	12·480
Total working expenses (less interest on capital)		27·98 do.	30·685

	Engines.	Carriages and Waggons.	Total Cost.

CALCULATIONS showing the Cost of hauling a Train of Coals with an Ordinary Engine compared with an Engine fitted with an Auxiliary Tender.

Load with an Ordinary Engine, 30 Trucks or 210 Tons.		Load with Engine and Auxiliary Tender, 45 Trucks or 320 Tons.	
Engine (including interest) -	10·0*d.* per mile	Engine (including interest) -	11·5*d.* per mile
Waggons do. -	3·5 „	Waggons do. -	5·0 „
Permanent way - -	5·0 „	Permanent way - -	6·5 „
Guards and greasing - -	1·5 „	Guards and greasing - -	2·0 „
Lighting and other charges -	3·5 „	Lighting and other charges -	3·5 „
	23·5×2=		28·5×2=
47·0*d.*, or 3*s.* 11*d.* per double mile.		57·0*d.*, or 4*s.* 9*d.* per double mile.	

PER-CENTAGE of Cost of Engine-power on Receipts in hauling the above loads :—

Receipts { 210 tons at ¾*d.* per ton per mile = 6*s.* 6½*d.* per double mile.
Expenses { 210 „ 20*d.* per double mile run, or 25 per cent. of receipts.

Receipts { 320 tons at ¾*d.* per ton per mile = 10*s.* per double mile.
Expenses { 320 „ 23*d.* per double mile run, or 19 per cent. of receipts.

RELATIVE Cost of Engine with Ordinary and with Auxiliary Steam Tender.

Engine with steam tender costs - - - - - £3,350
Do. without do. - - - - - £2,900

Two engines with steam tenders drag the load of three engines with ordinary tenders.

£2,900 × 3 = £8,700
3,350 × 2 = 6,700

£2,000 less cost, or £2,000 = 23 per cent. less capital for a similar amount of traffic.

Adjourned sine die.
